About Tencent Blade Team

- **A security research team from Tencent Security Platform Department**
- **Focus on security research of AI, IoT, Mobile**
- **Has found 70+ security vulnerabilities (Google, Apple, Adobe)**
- **Research output has been widely used in Tencent products**

*Tencent Security

Agenda

Part 1:

- **Introduction to Intelligent Building**
- **Automatic Attack on ZigBee Network**

Part 2:

- **Practical Attack on KNX Network**
- **Security Advice**

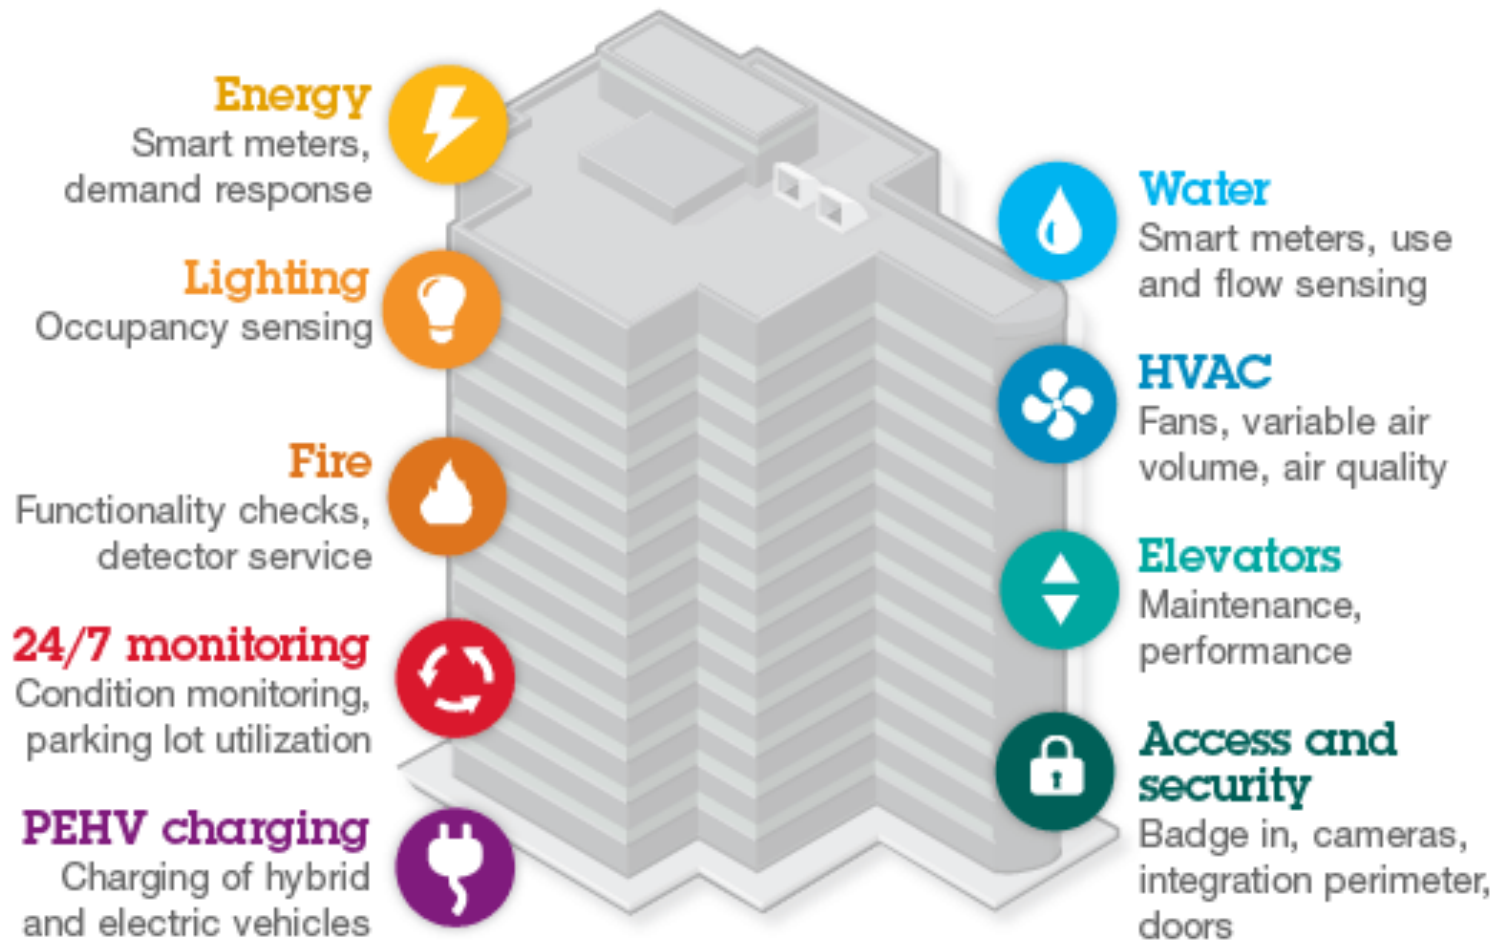

Introduction to Intelligent Building

- **What is Intelligent Building**
- **Why Intelligent Building**
- **Building Automation and Home Automation**
- **A Demo of Remote Attack Intelligent Building**

What is Intelligent Building

Why Intelligent building

- There are few researches on the security of intelligent buildings, we think its security problem will become more serious.
- We want to work with the security community to enhance the safety of Intelligent building.

Building Automation & Home Automation

Home Automation

Building Automation

Building Automation & Home Automation

Home Automation

Building Automation

Let's set a small goal and make it possible

A city skyline at dusk or dawn. The sky is a mix of orange, pink, and blue. In the foreground, there are several modern, multi-story buildings with white facades and large windows. In the background, a tall, slender skyscraper is illuminated with bright blue lights, standing out against the colorful sky. Other buildings of varying heights and colors (red, yellow, green) are visible in the mid-ground.

**CAN WE REMOTE ATTACK
INTELLIGENT BUILDINGS?**

DEMO

It's cool, isn't it?

Let me show you how we did it.

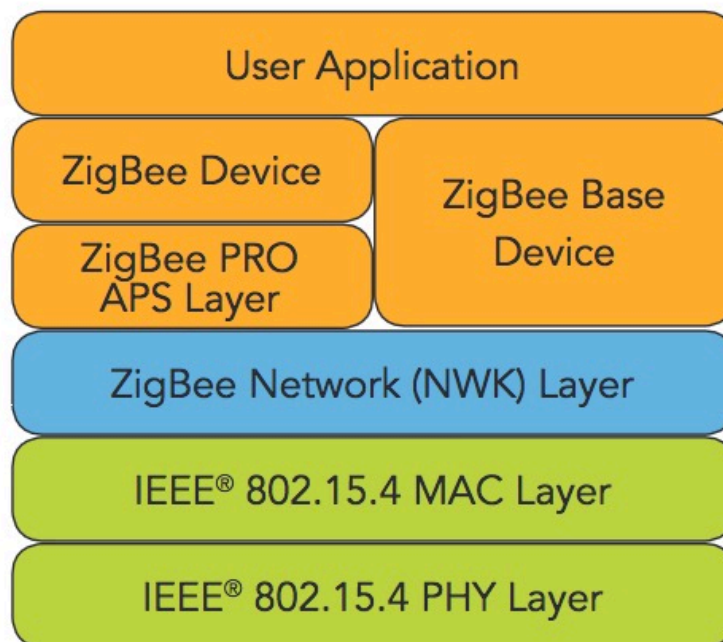

Automatic Attack on ZigBee Network

- **What is ZigBee**
- **ZigBee Security Measure**
- **Current Risks on ZigBee**
- **Previous ZigBee Security testing tools**
- **Automated Attack ZigBee network**
- **ZomBee : A New ZigBee Pentest tools**

What is ZigBee

- ZigBee is an open global standard for wireless technology designed to use low-power digital radio signals for personal area networks.
- ZigBee standard operates on the IEEE 802.15.4 physical radio specification and operates in unlicensed bands including 2.4 GHz, 900 MHz and 868 MHz .

What is ZigBee

- **Coordinator**

Network establishment and Control

- **Router**

Supports routing functionality, can talk to other routers ,coordinator, and end Devices

- **End Device**

Can only talk to routers and the coordinator

ZigBee Security Measure

- **ZigBee Security Features**
- **ZigBee Security Keys**
- **ZigBee Security Security Model**
- **Security During Commissioning**

ZigBee Security Features

ZigBee security is based on symmetric-key cryptography

- Uses the highly secure 128-bit AES-based encryption.
- Keys reusing among layers of the same device.
- Same security level for all devices on a given network and all layers of a device.
- ZigBee command includes a frame counter to stop replay attack.
- Access control lists.

ZigBee Security Keys

- **Link Key**

This is uniquely shared between two devices and can be used to encrypt unicast messages between them. If a device shared a Link Key with the Trust Center it can be used to encrypt the transfer of the Network Key to a node joining the network.

- **Network Key**

Shared between every device on the network and can be used for NWK layer encryption and protecting broadcast traffic. They can be pre-installed on devices or transported from the Trust Center.

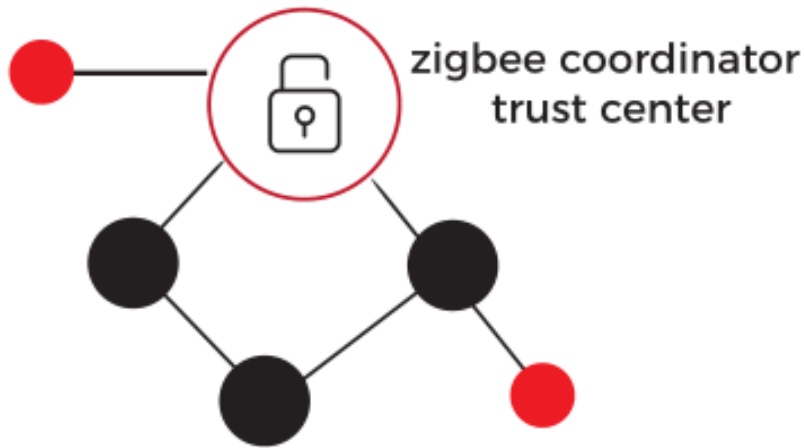

- **Master Key**

Used for SKKE Establishment of Link Keys. Usually pre-installed.

ZigBee Security Model

Centralized Security Model

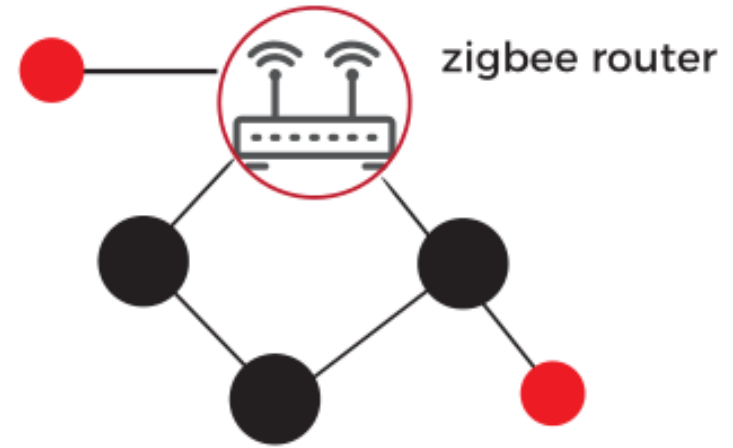

The TC establishes a unique TC Link Key for each device.

Node must support install codes (128 bits of random data + 16 bit CRC).

the Trust Center periodically creates, distributes, and then switches to a new network key.

Distributed Security Model

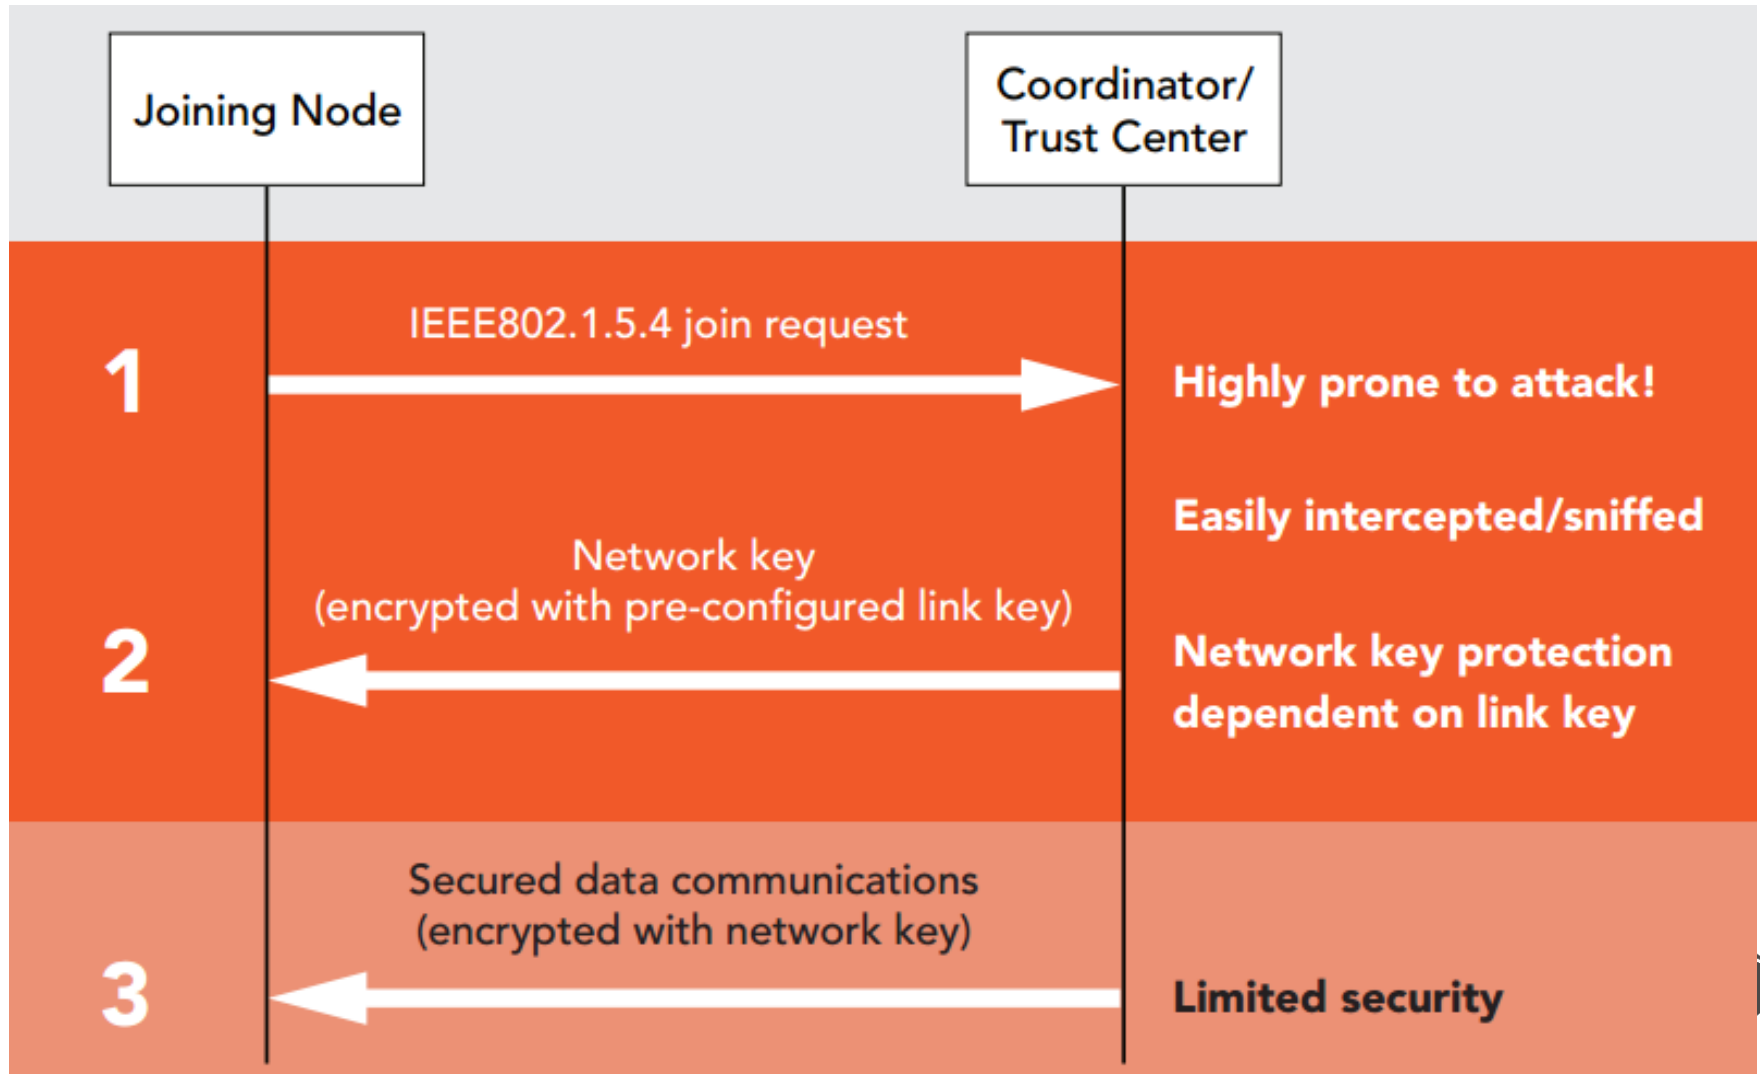

For easier-to-configure systems .

No Coordinator / Trust Center.

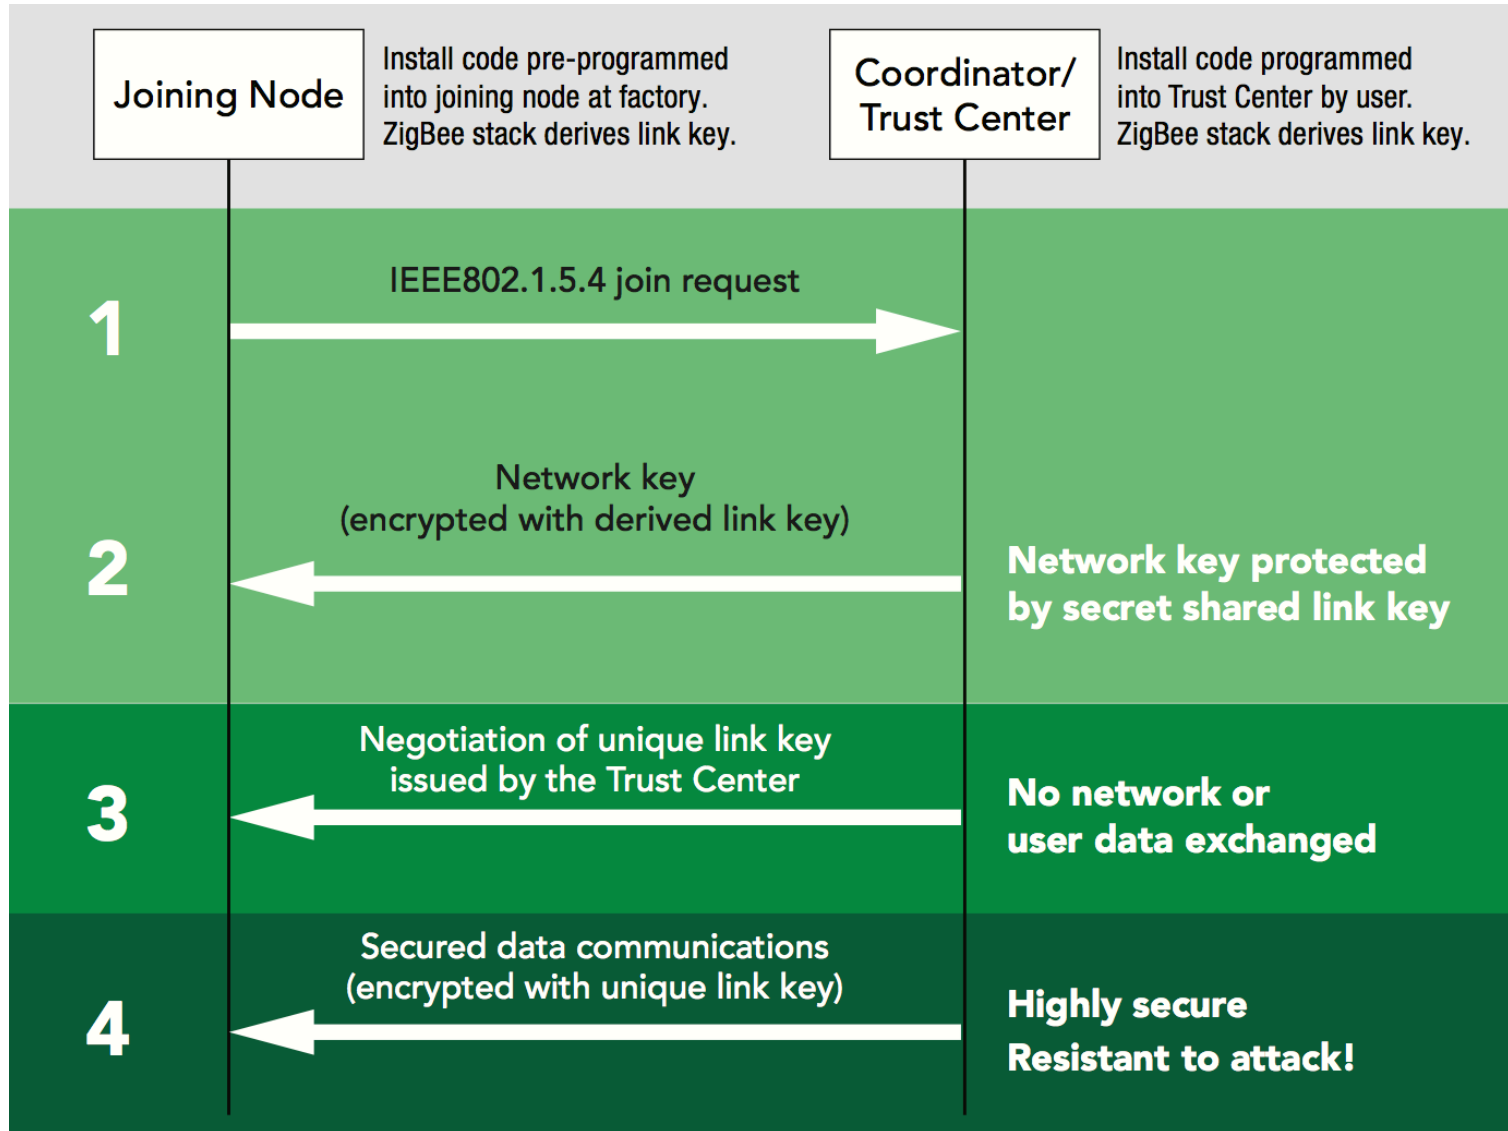

All devices must be pre-configured with a link key to encrypt the network key when a new node joining.

All the devices in the network encrypt messages with the same network key.

Security During Commissioning

Security During Commissioning

Current Risks on ZigBee

- **Use a well-known security key**

- (1) Default global link key: ZigBeeAlliance09

- (2) Silicon Labs ZigBee chip default preconfigured Link key: Zigbee Security!

- (3) Silicon Labs ZigBee chip default Network key: ember EM250 chip

- **Insecure key transport over the air**

- (1) In some devices that use old ZigBee stack, it's easy to sniff the network key if transport key in clear text.

- (2) A knowledge of the link key makes obtaining the network key possible by capturing over-the-air packets.

Current Risks on ZigBee

- **Insecure key storage**

In the device's firmware or flash chip hard-coded key in plaintext

- **Insecure rejoin and reuse the TC Link key**

A node device can send a rejoin request to the network, and the network key will be transported again. And if the same link key is used for every join attempt, it opens up the system to rejoin security attacks.

- **Replay protection bypass**

If the network key is obtained, we can decrypt the NwkSeq number and frame counter from the packet so that it is automatically updated to the new value when the packet is injected.

Previous ZigBee Security Testing Tools

ZigBee Sniffer Tools

- **Wireshark**

USRP B210

Atmel RZ RAVEN USB Stick

Automated Attack ZigBee network

If we want to quickly and automatically attack ZigBee devices in the city, we need to solve more problems:

- There are a lot of ZigBee devices in a building and it takes a lot of time to attack.
- The power of ZigBee transmitter is limited, which can't cover the whole floor at the same time.
- Multiple ZigBee networks are distributed in different rooms and channels, we can only specify one channel at a time to sniff and send packets.

Automated Attack ZigBee network

New improvements

- Support attack multi ZigBee network quickly

Increase the number of ZigBee sniffer and transmitter devices on raspberry pi to accelerate network scanning and attack speeds through multithreading.

Automated Attack ZigBee network

New improvements

- **Support batch attack**

We create a virtual device in every network that collected, this virtual device will be set a random NwkAddr (0x0000 - - 0xffff7), and a IEEE/MAC address same as a device in the network, and its NwkSeq number and frame counter will start with 0.

In most of ZigBee devices we tested , if we use this virtual device to send a broadcast packets with correct PANID, it can be used to batch attack all node device in ZigBee network.

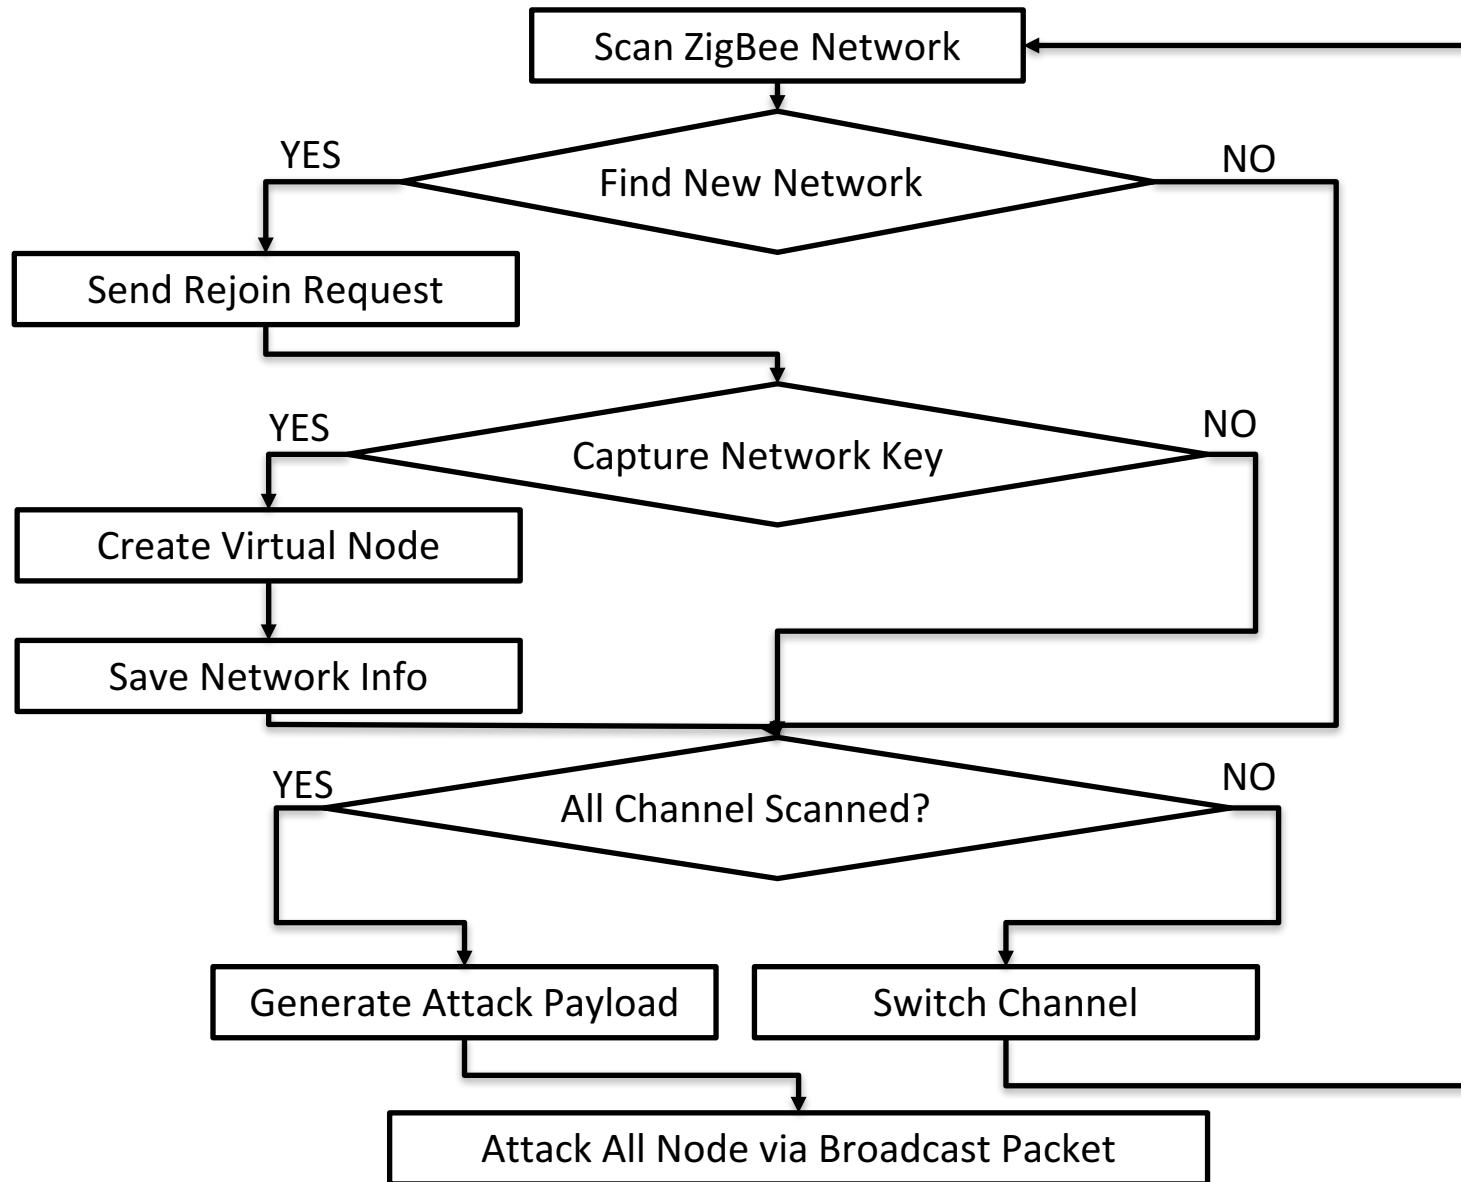

ZomBee: A New ZigBee Pentest tools

- A ZigBee Network Automated Security Testing tool.
- Based On Raspberry Pi 3B and Atmel RZ RAVEN USB Stick.
- 64-bit OS inside.
- Can be carried in a drone or any other space that can hold a small box.

ZomBee: A New ZigBee Pentest tools

Review

Part 1:

- Introduction to Intelligent Building
- Automatic Attack on ZigBee Network

Part 2:

- Practical Attack on KNX Network
- Security Advice

Practical Attack on KNX Network

- Introduce KNX Network
- KNX Security Model
- Attack KNX Network

Why is KNX

- KNX is a widely used communication protocol for building automation
- KNX standard is administered by the KNX Association
- Less research on KNX security

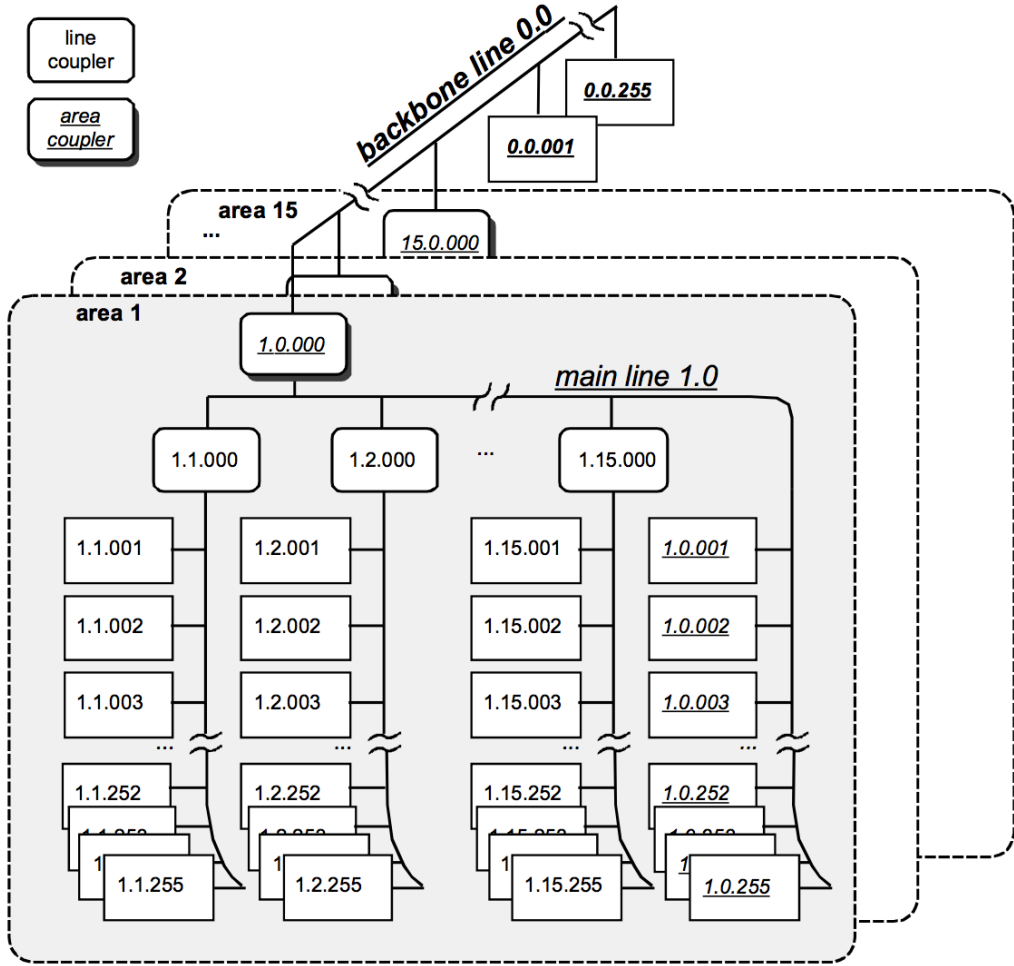

Basic Knowledge

- KNX devices categories
 - System devices and components
 - Terminal devices
- KNX communication media
 - Twisted Pair (TP)
 - IP (KNXnet/IP)
 - Power Line and Radio Frequency

Basic Knowledge

- The KNX topology

Basic Knowledge

- Addressing between devices
 - Individual address
 - Group address
- ETS for KNX installation
 - Design topology architecture
 - Configure the device
 - Monitor bus or group telegram

Topology

+ Add | - Delete | Download | Info

Topology

- Dynamic Folders
- 1 My area
 - 1.1 Router 1 line
 - 1.1.0 IP-Router N 146/02
 - 1.1.2 Arina touch sensor, UP 203
 - 1.2 Router 2 line
 - 1.2.0 IP-Router N 146/02
 - 1.2.2 Load switch N 510/03, N 510/04

Group Addresses

+ Add | - Delete | Download | Info

Group Addresses

- Dynamic Folders
- 1 My group
 - 1/0 Room 1
 - 1/0/0 switch1
 - 1/0/1 switch2
 - 1/0/2 state1
 - 1/0/3 state2
 - 1/1 Room 2

Start Stop Clear Open Save Print Replay Telegrams Options Group Functions

Group Address: Data point type: Raw (one byte or more)

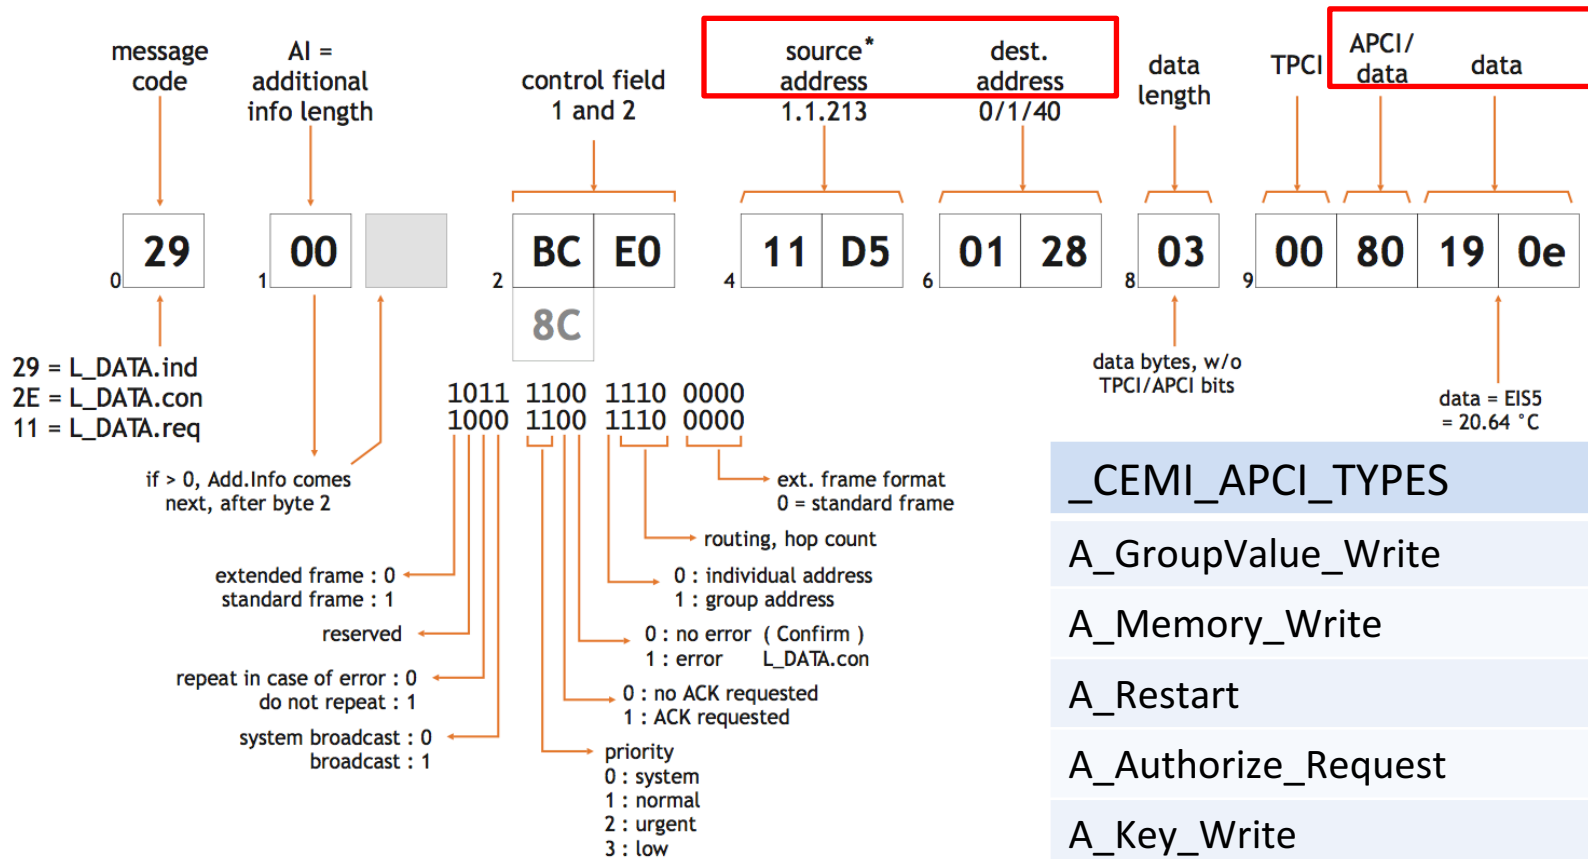

Last received value: Value: use hex values

Delay time[sec] Send cyclically

cEMI Here !

Routing mechanism

- KNXnet/IP Router vs Interface
 - IP Interface supports KNXnet/IP Tunnelling only
 - IP Router also supports KNXnet/IP Routing
- Group Address Filtering
 - All KNX Group Address telegrams received by a KNXnet/IP Router shall be subject to Group Address filtering

1.1.0 IP-Router N 146/02 > Routing (Bus > IP)

General

Group telegrams of main groups 0 to 13

filter (normal) ▼

Routing (Bus > IP)

Group telegrams of main group 14 and 15

block

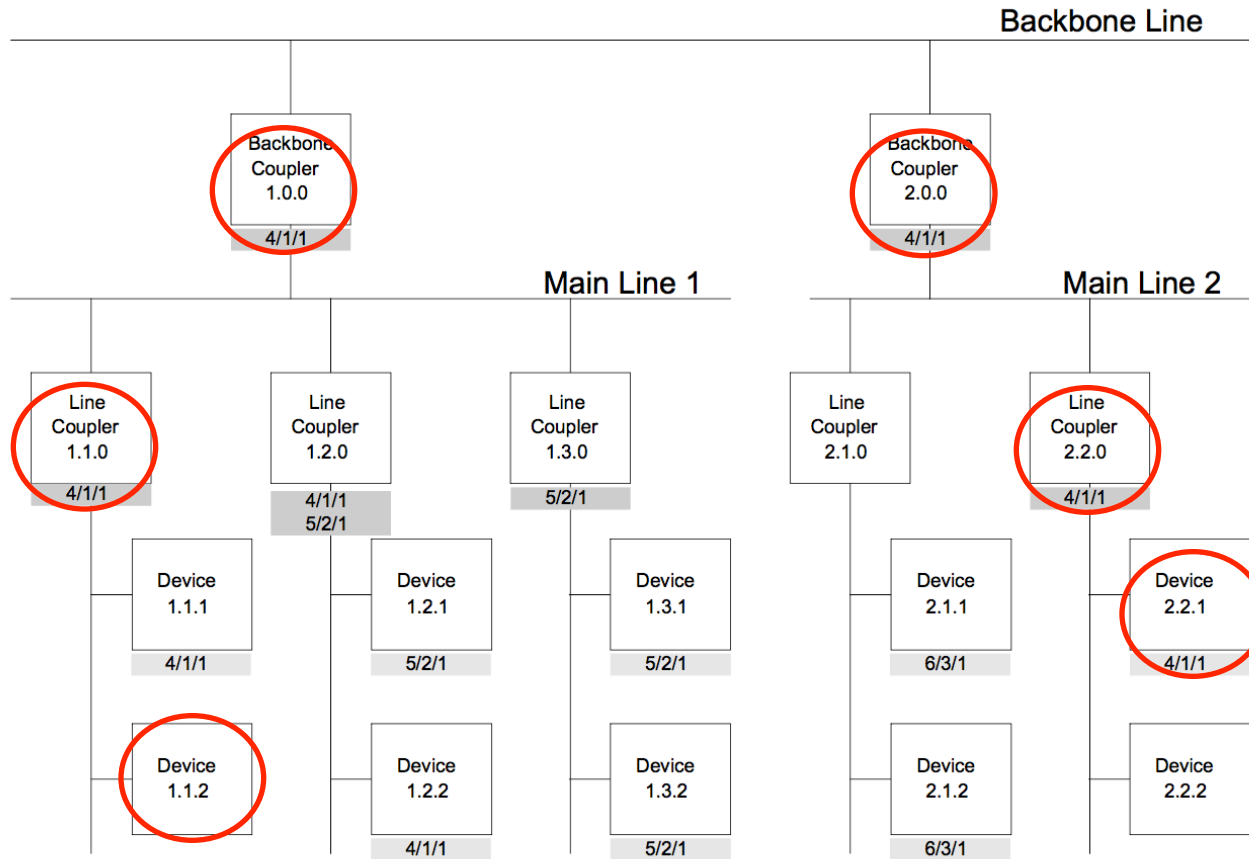

transmit all

Routing mechanism

- Group Address Filtering

1.1.2 send 4/1/1
2.2.1 recv 4/1/1

KNX Security Model

- KNX Secure
 - KNX data secure
 - KNX IP secure
- Current Situation
- Attack Surface
 - The weakness of KNX protocol
 - Weak security awareness during installation

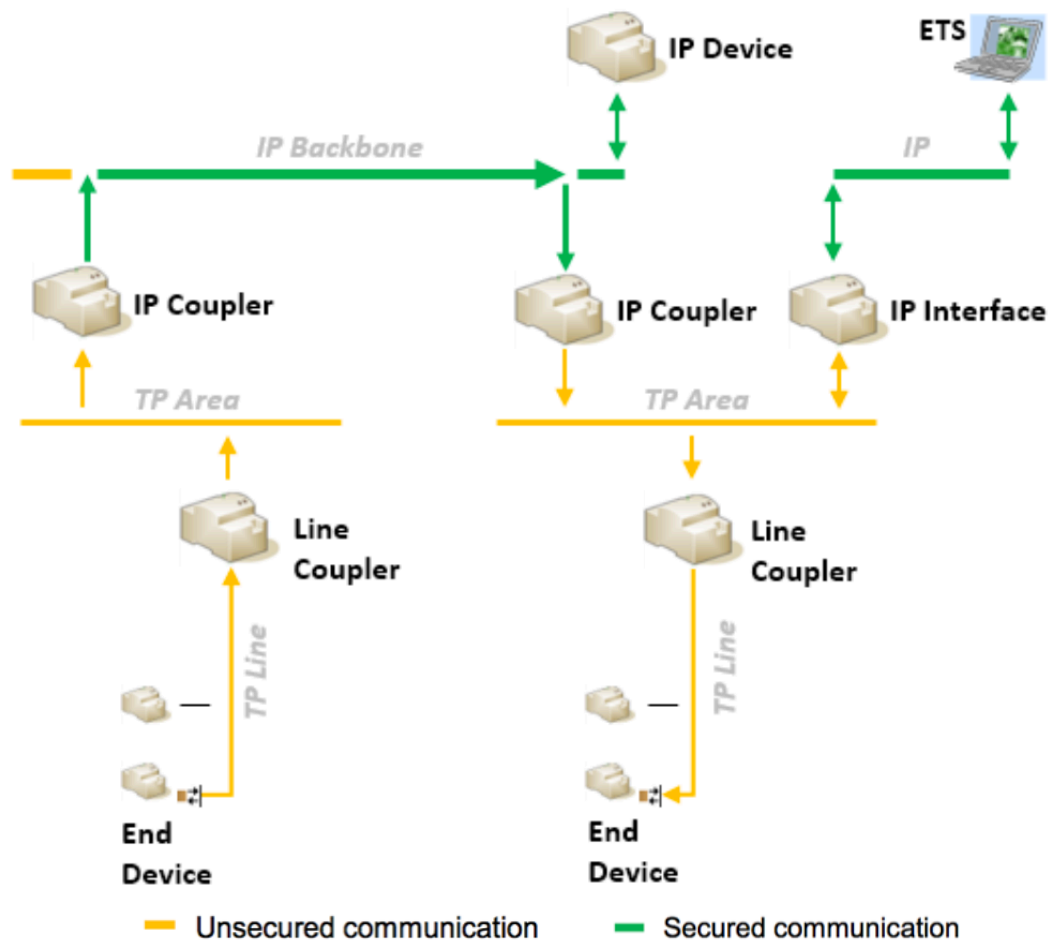

KNX Secure

- KNX data secure
 - KNX Data Secure encrypts the APCI and the payload

KNX Secure

- KNX IP secure
 - KNX IP Secure encrypts the entire KNXnet/IP frame

Current Situation

- Attack surface still exists in most KNX networks
 - Some devices still do not support KNX secure.
 - Use earlier versions of ETS for installation
 - High renovation cost of existing buildings
- Attack surface of KNX
 - The weakness of KNX protocol
 - Weak security awareness during installation

Attack Surface

- The weakness of KNX protocol
 - Traffic is not encrypted and can be sniffed
 - Unable to prevent replay attacks
 - Device can be reprogrammed
- Weak security awareness during installation
 - No isolation in each room
 - No set authentication key
 - No encryption and lack of access control in LAN

Experimental Setup

Experimental Setup

- KNX IP
 - IP-Router N146/02
- KNX USB
 - USB interface N148
- KNX Power
 - Power supply N125
- KNX Node
 - Load switch N 510
 - Arina touch sensor
- Router

Experimental Setup

- Tools for attack
 - ETS (<https://www.knx.org/za/software/overview/index.php>)
 - KNXmap (<https://github.com/takeshixx/knxmap/>)
 - Calimero (<https://github.com/calimero-project>)
 - Net'n Node (<https://www.weinzierl.de/index.php>)

Attack KNX Network via KNXnetIP

- Step1: Enter the LAN where KNX is located
 - Cracking WiFi password / Weak password
 - Access switchs physically in the room

Attack KNX Network via KNXnetIP

- Step2: Discover devices and build topology
 - Scan couplers and devices

```
C:\Users\lulu\knxmap-master>python main.py scan 10.118.16.101
Scanning 1 target(s)
```

```
10.118.16.101
Port: 3671
```

```
MAC Address: 00:0E:8C:00:8A:F4
KNX Bus Address: 1.1.0
Additional Bus Addresses:
  1.1.9
KNX Device Serial: 0001002043BE
KNX Medium: KNX TP
Manufacturer: Siemens
Device Friendly Name: IP Router N146
Device Status:
```

```
  Programming Mode: ENABLED
  Link Layer: disabled
  Transport Layer: disabled
  Application Layer: disabled
  Serial Interface: disabled
  User Application: disabled
  BC DM: 0
```

```
Project Install Identifier: 0
Supported Services:
```

```
  KNXnet/IP Core
  KNXnet/IP Device Management
  KNXnet/IP Tunnelling
  KNXnet/IP Routing
```

Individual addresses to scan

Area: 1, Line: 2, Device Start: 1, Device End: 10

```

Attack KNX Network via KNXnetIP

In DefCon 22, a security researcher showed how to hack the lighting control system in the St.Regis Hotel via the hotel's WIFI network.

If Ethernet is isolated ?

Maybe.. Attack KNX network via KNX TP.
Real-world attack?

Attack KNX Network via KNX TP

OUR TARGET

Marriott Hotel

- 340 rooms
- 300 meters
- Ocean view

Tencent Security
Platform Dpt.

Attack KNX Network via KNX TP

You can use KNX smart panel control in your room, including features such as :

- Light switch with brightness
- Air conditioning temperature
- TV switch
- Music switch
- Curtain switch
- But, Ethernet is isolated

Attack KNX Network via KNX TP

- Step1: Enter the BUS where KNX is located
 - Look for KNX devices in the room

Attack KNX Network via KNX TP

- Step1: Enter the Bus where KNX is located
 - Look for KNX devices in the room
 - Access KNX network via TP and USB Interface

USB interface

Tencent Security
Platform Dpt.

Attack KNX Network via KNX TP

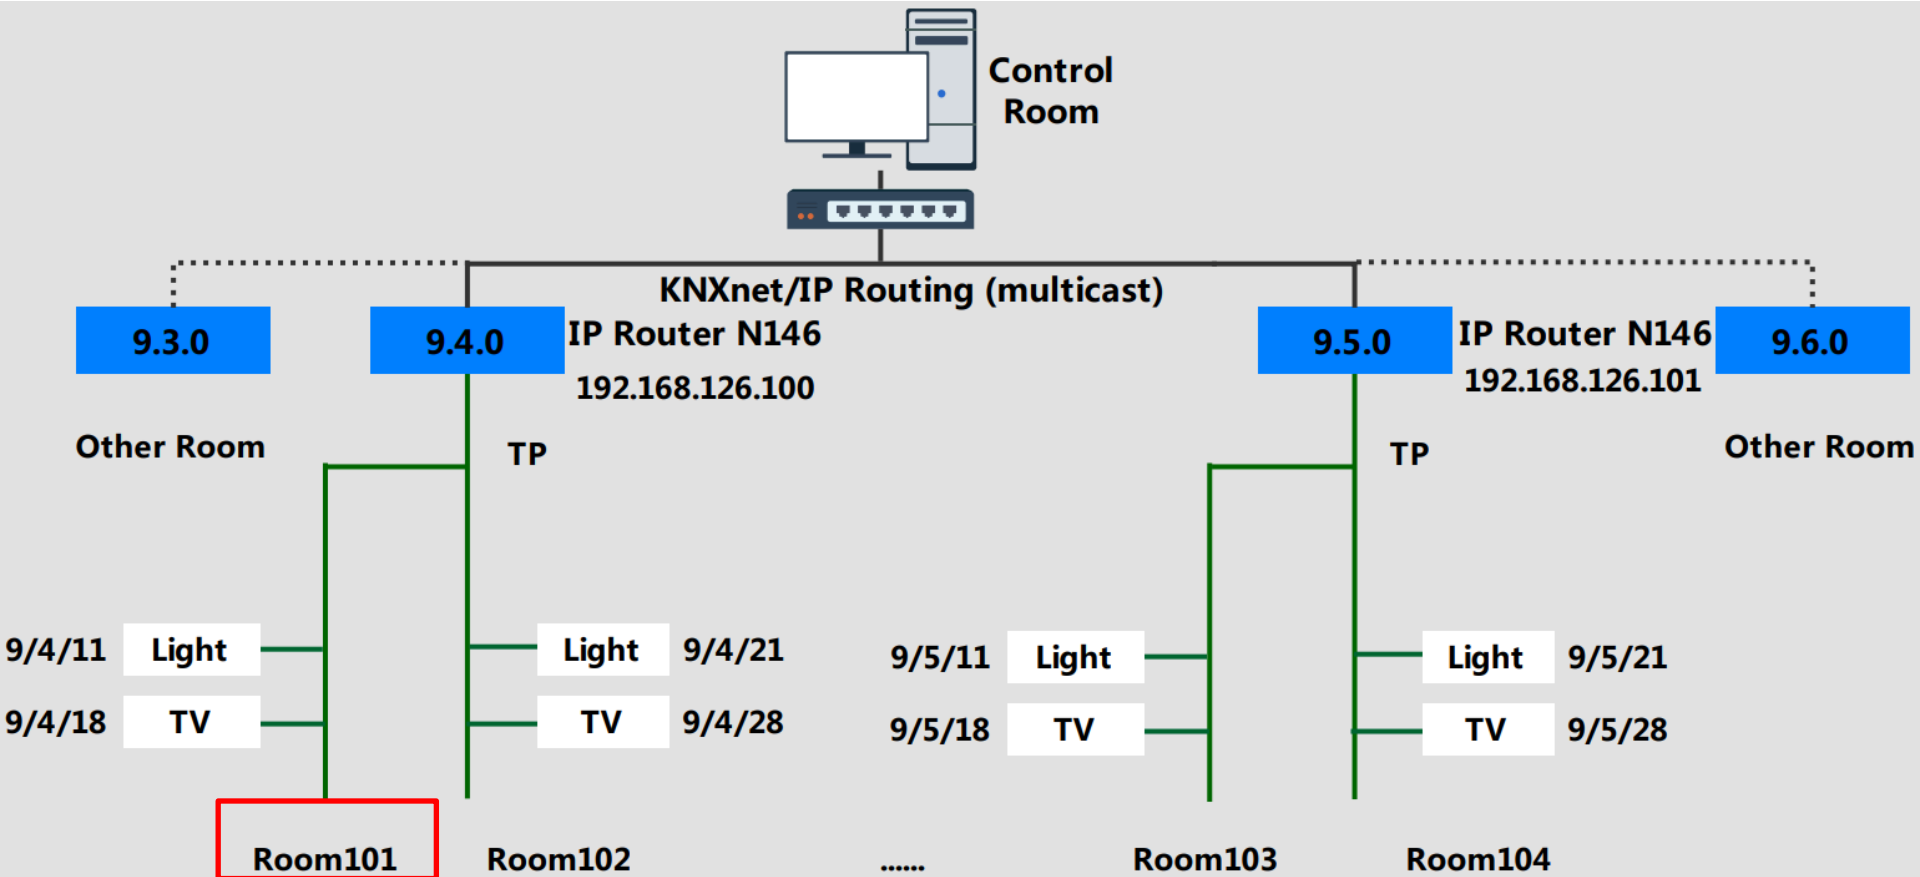

- Step2: Discover devices and build topology
 - Monitor group telegram or bus data
 - Scan the device on Line
 - Get the coupler's detail

Name	Value
KNXnet/IP server	9.4.0
name	IP Router N146
Supported IP assignment methods	manual, DHCP, Auto IP
Enabled IP assignment methods	manual
Current IP assignment method	manual
Routing capabilities	queue overflow statistics, transmitted telegrams statistics,
Configured IP address	192.168.126.100
Configured subnet mask	255.255.255.0
Current IP address	192.168.126.100
Current subnet mask	255.255.255.0
Configured default gateway	192.168.126.254
Current default gateway	192.168.126.254
DHCP/BootP server	0.0.0.0
Routing multicast	224.0.23.12

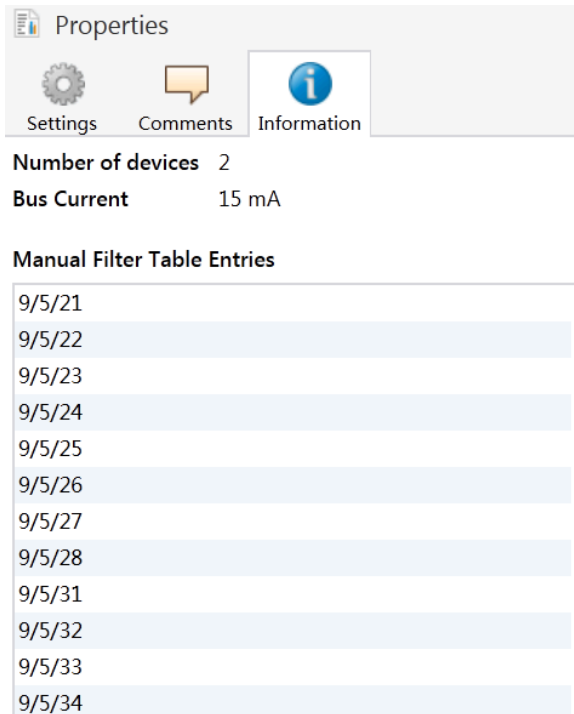

Attack KNX Network via KNX TP

- Step2: Discover devices and build topology
 - IP Router as coupler and share with two rooms
 - Guess the group address in the other rooms

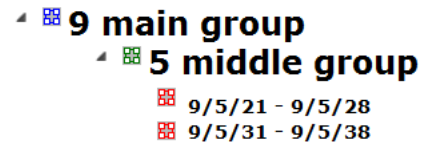

Attack KNX Network via KNX TP

- Step3: Modify group filter tables
 - Brute-force cracking authentication key (the default is 0xFFFFFFFF)
 - Send APCI data to enable program mode
 - Use ETS to configure group filter tables on each Line

The screenshot shows the 'Properties' dialog box for a KNX line. It has three tabs: 'Settings' (selected), 'Comments', and 'Information'. Below the tabs, it displays 'Number of devices 2' and 'Bus Current 15 mA'. At the bottom, there is a section titled 'Manual Filter Table Entries' with a list of 14 rows, each containing a date from 9/5/21 to 9/5/34.

Manual Filter Table Entries
9/5/21
9/5/22
9/5/23
9/5/24
9/5/25
9/5/26
9/5/27
9/5/28
9/5/31
9/5/32
9/5/33
9/5/34

The screenshot shows a hierarchical view of KNX groups. It starts with '9 main group', which is expanded to show '5 middle group'. This middle group is further expanded to show two sub-groups: '9/5/21 - 9/5/28' and '9/5/31 - 9/5/38'.

- 9 main group
 - 5 middle group
 - 9/5/21 - 9/5/28
 - 9/5/31 - 9/5/38

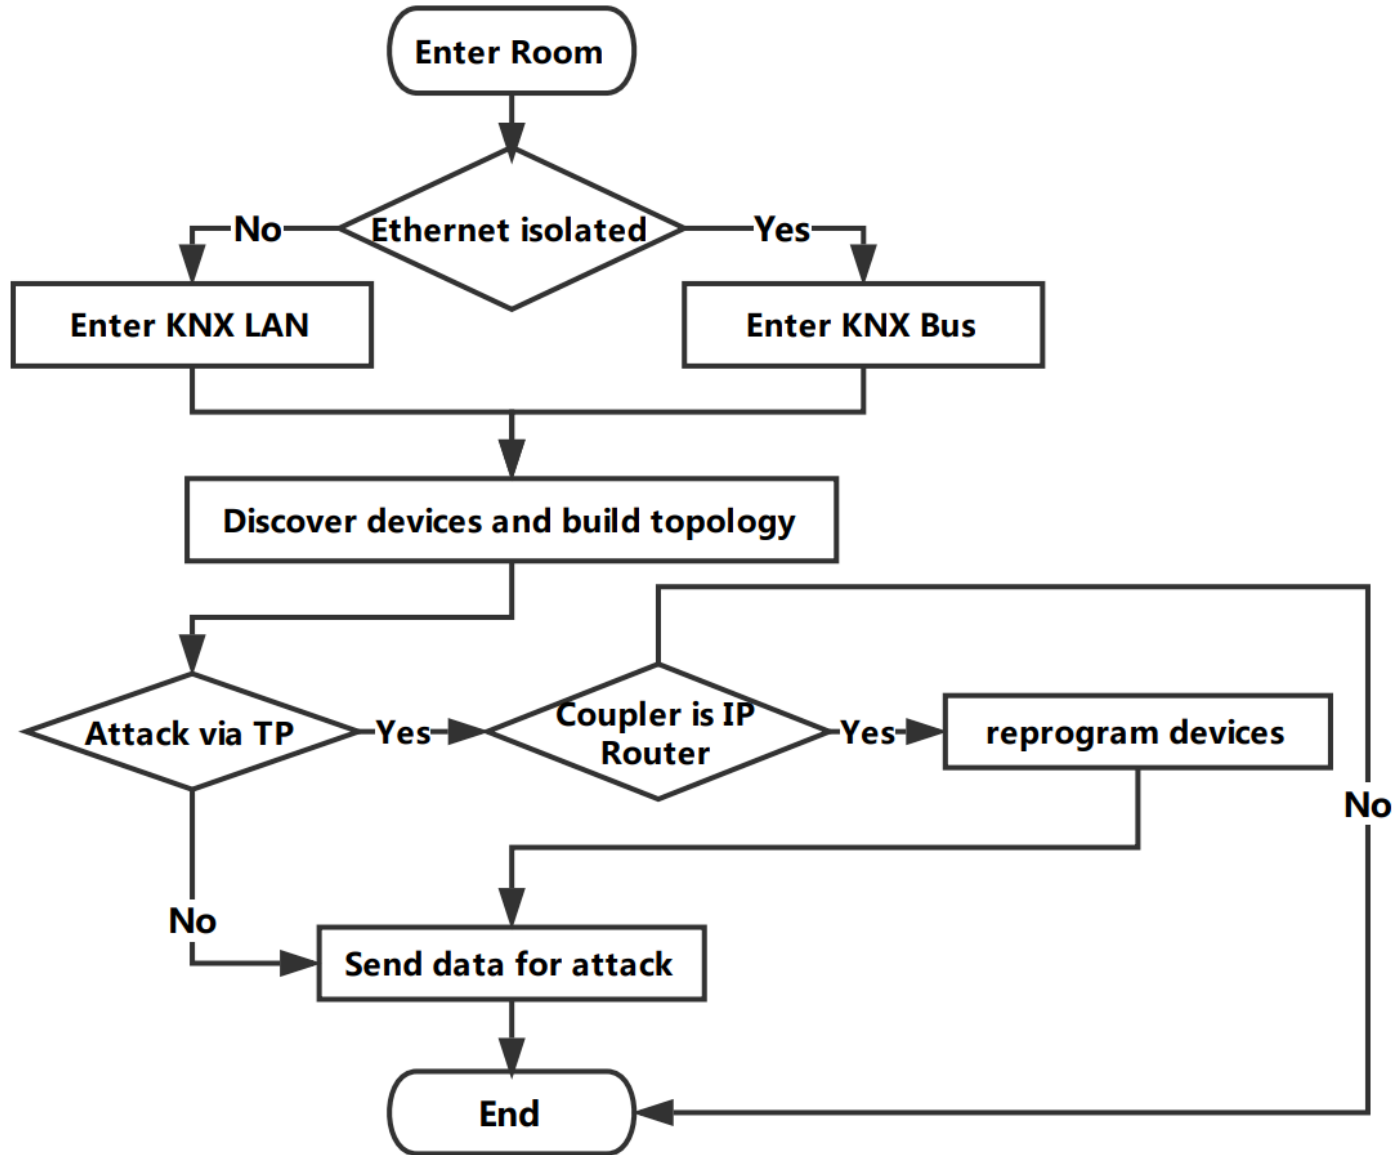

Attack KNX Network via KNX TP

- Step4: Send malicious data for attack
 - Traversing all devices and send data
 - Send group telegram to control devices on the other line
 - Send APCI data to devices

Attack KNX Network

Security Advice

- ZigBee Security Advice
- KNX Security Advice

ZigBee Security Advice

- Update network keys regularly.
- Don't use any well-known security key.
- Implement custom secure encryption in the application layer (If do not need to be compatible with other devices).

KNX Security Advice

- Don't expose KNX gateways on public networks.
- Make sure each room is isolated .
- Ensure network security including WiFi and switches.
- Use new devices and the latest version of ETS to implement KNX secure.

Thank You
