Handling Crypto

Results

Overview

Symbolic Execution

4-way handshake

Handling Crypto

Results

Symbolic Execution

```
void recv(data, len) {  
    if (data[0] != 1) ← Mark data as symbolic  
        return  
    if (data[1] != len)  
        return  
  
    int num = len/data[2]  
    ...  
}
```

Mark data as symbolic

Symbolic branch

Symbolic Execution

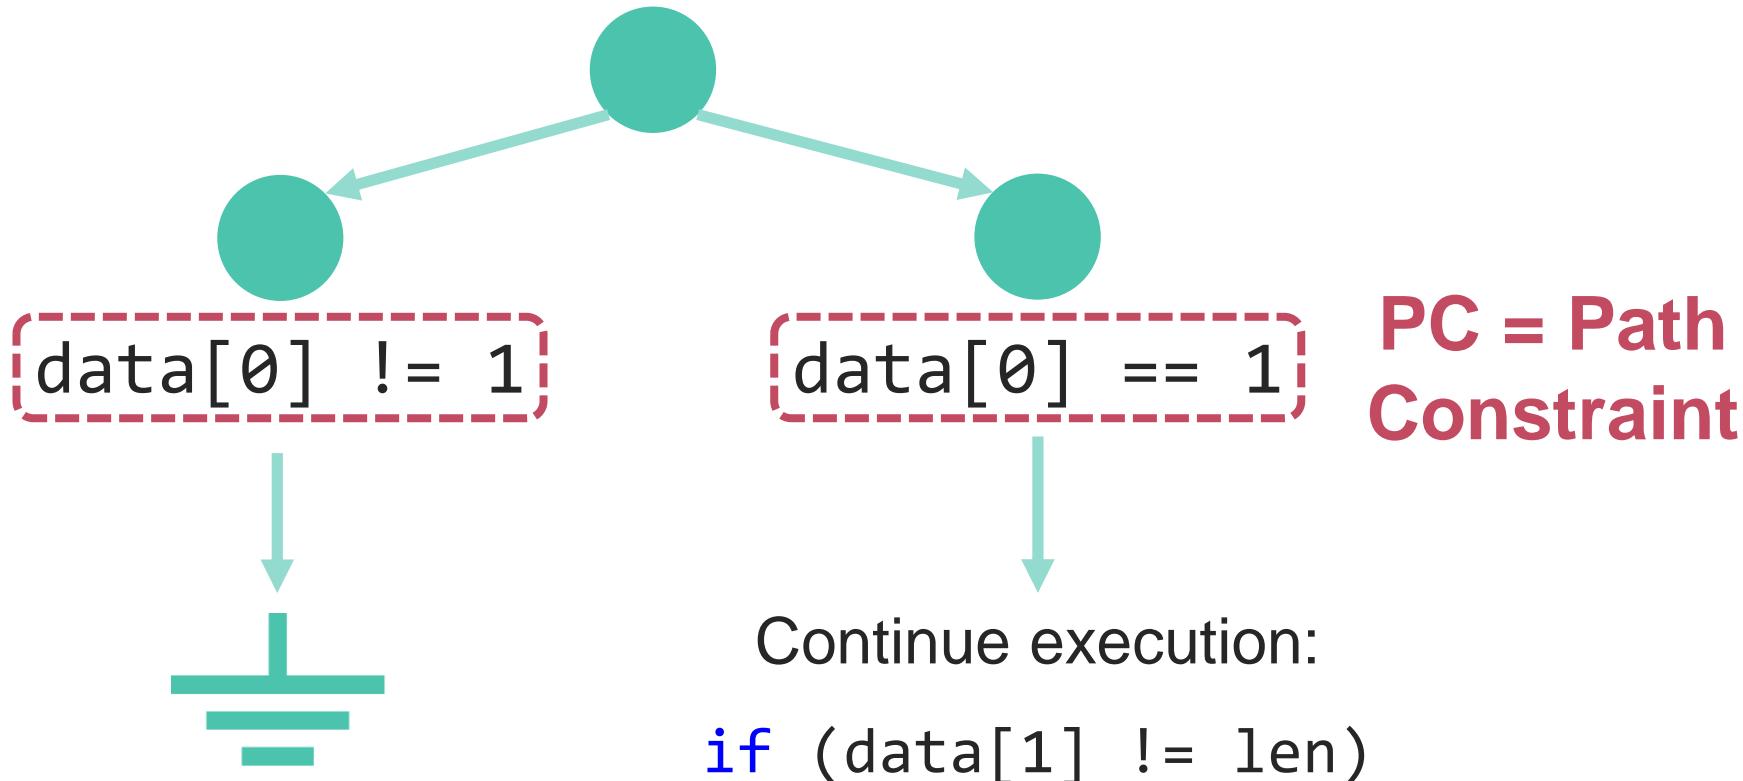

data[0] != 1

```
void recv(data, len) {  
    if (data[0] != 1)  
        return  
    if (data[1] != len)  
        return  
  
    int num = len/data[2]  
    ...  
}
```

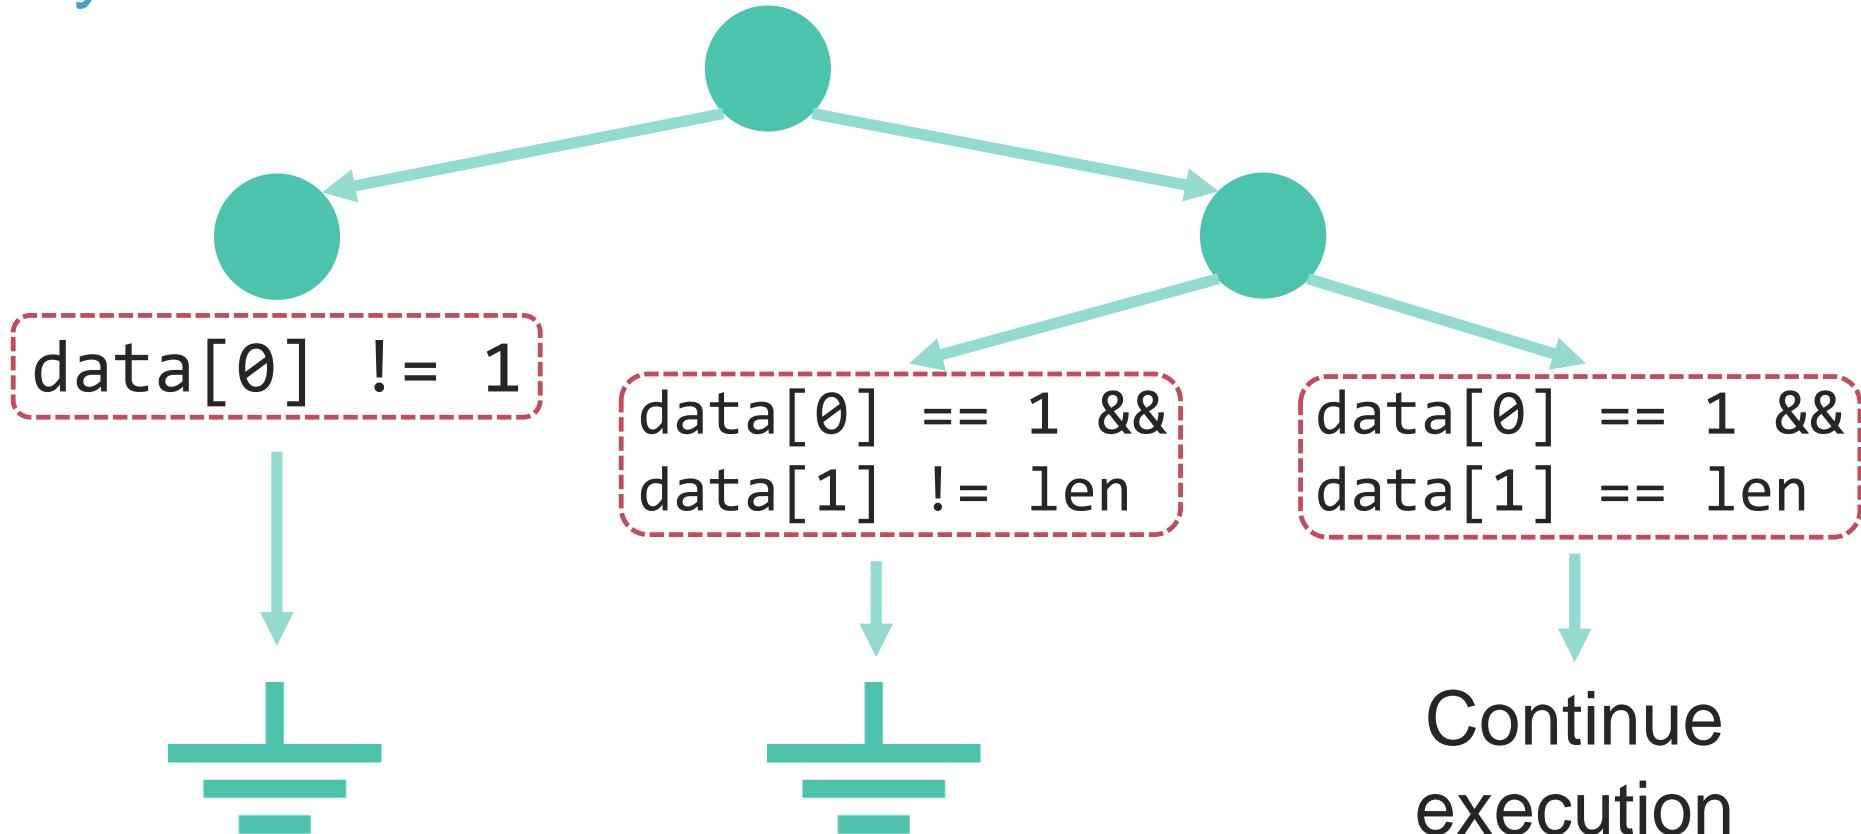

data[0] == 1

```
void recv(data, len) {  
    if (data[0] != 1)  
        return  
    if (data[1] != len)  
        return  
  
    int num = len/data[2]  
    ...  
}
```

Symbolic Execution

Symbolic Execution

Symbolic Execution

```
data[0] == 1 &&
data[1] == len

void recv(data, len) {
    if (data[0] != 1)
        return
    if (data[1] != len)
        return

    int num = len/data[2] ←
    ...
}
```

Yes! Bug detected!

Can data[2] equal zero
under the current PC?

Implementations

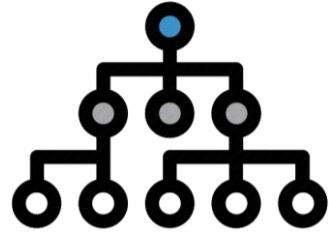

- We build upon KLEE
 - › Works on LLVM bytecode
 - › Actively maintained

Practical limitations:

- › $|paths| = 2^{|if-statements|}$
- › Infinite-length paths
- › SMT query complexity

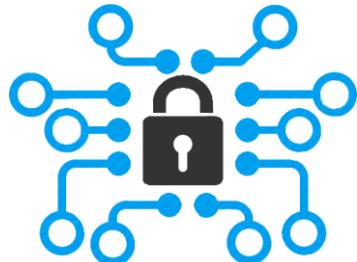

Overview

Symbolic Execution

4-way handshake

Handling Crypto

Results

Motivating Example

```
void recv(data, len) {  
    plain = decrypt(data, len) ← Summarize crypto algo.  
    if (plain == NULL) return  
  
    if (plain[0] == COMMAND) ← Analyze crypto algo.  
        process_command(plain)  
    else  
        ...  
}
```

Mark data as symbolic

(time consuming)

Won't reach this function!

Efficiently handling decryption?

Decrypted output

=

fresh symbolic variable

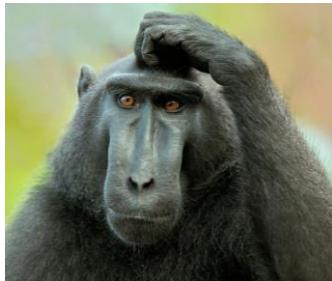

Example

```
void recv(data, len) {  
    plain = decrypt(data, len) ← Create fresh  
    if (plain == NULL) return symbolic variable  
  
    if (plain[0] == COMMAND) } Normal analysis  
        process_command(plain)  
    else  
        ... → Can now analyze code  
    } that parses decrypted data
```

Other than handling decryption

Handling hash functions

- › Output = fresh symbolic variable
- › Also works for HMACs (Message Authentication Codes)

Tracking use of crypto primitives?

- › Record relationship between input & output
- › = Treat fresh variable as information flow taint

Detecting Crypto Misuse

Timing side-channels

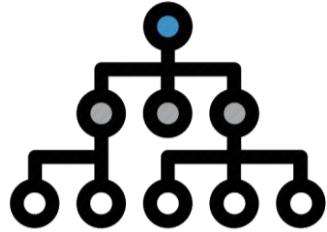

- › $\forall(paths)$: all bytes of MAC in path constraint?
- › If not: comparison exits on first byte difference

Decryption oracles

- › Behavior depends on unauth. decrypted data
- › Decrypt data is in path constraint, but not in MAC

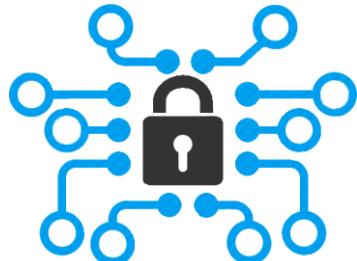

Overview

Symbolic Execution

4-way handshake

Handling Crypto

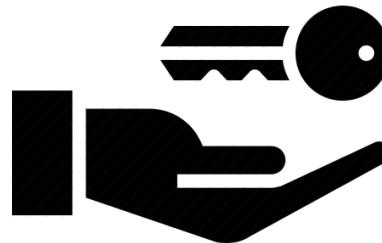

Results

The 4-way handshake

Used to connect to any protected Wi-Fi network

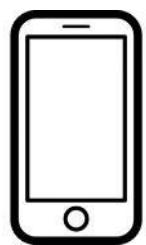

Mutual authentication

Negotiates fresh PTK:
pairwise transient key

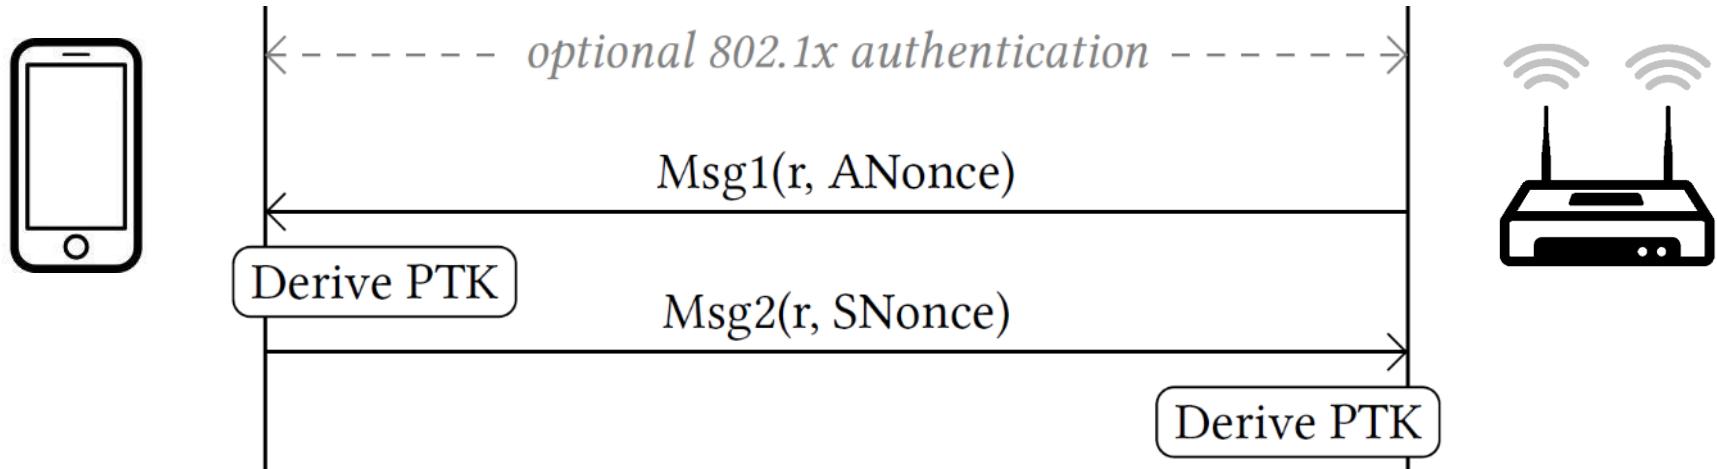

4-way handshake (simplified)

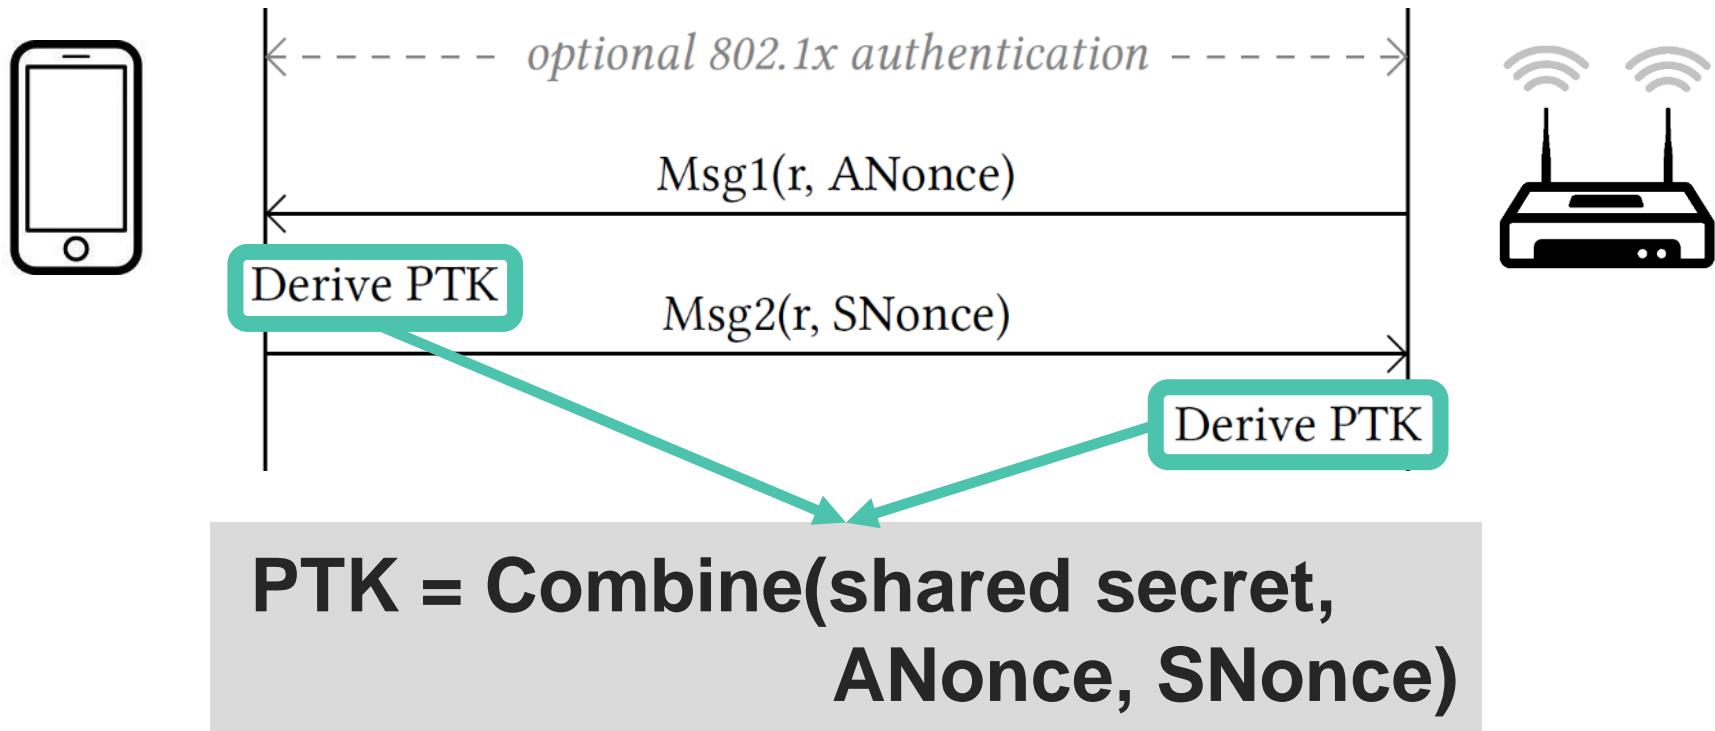

optional 802.1x authentication

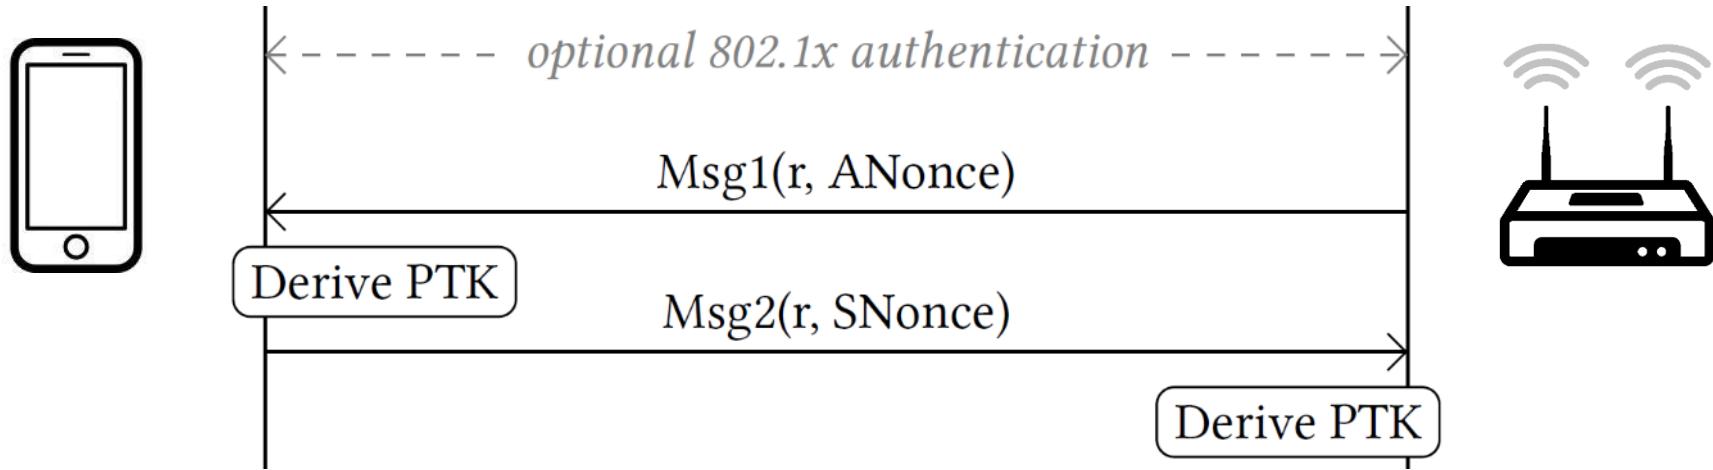

4-way handshake (simplified)

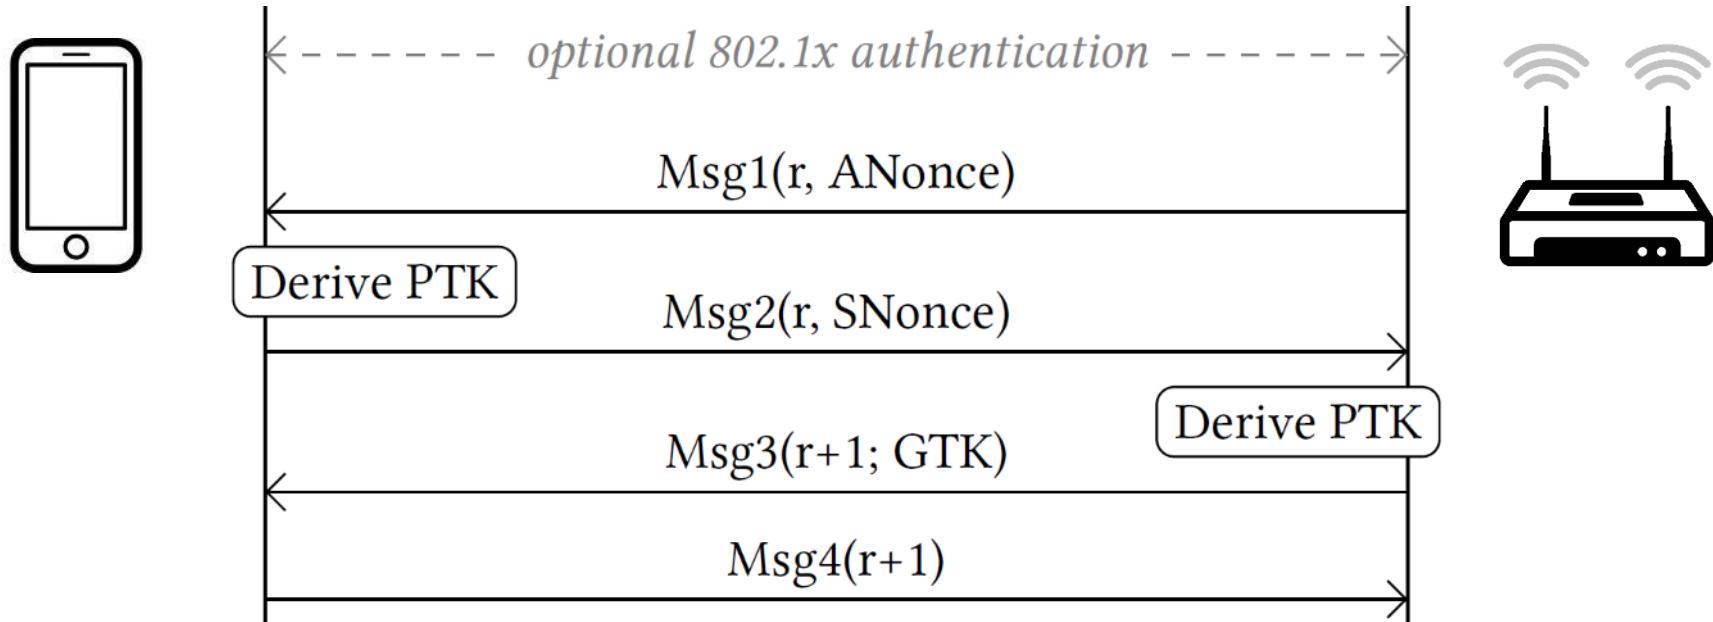

4-way handshake (simplified)

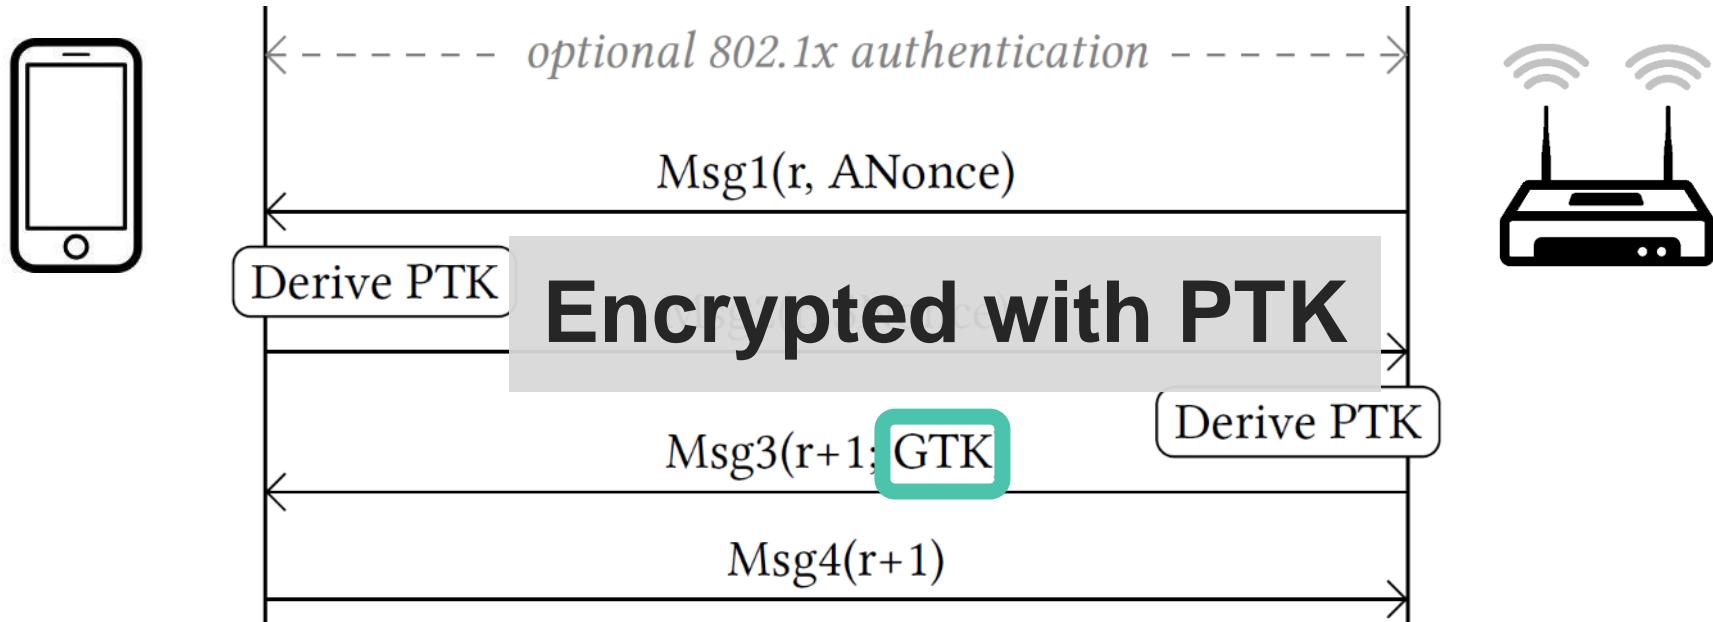

4-way handshake (simplified)

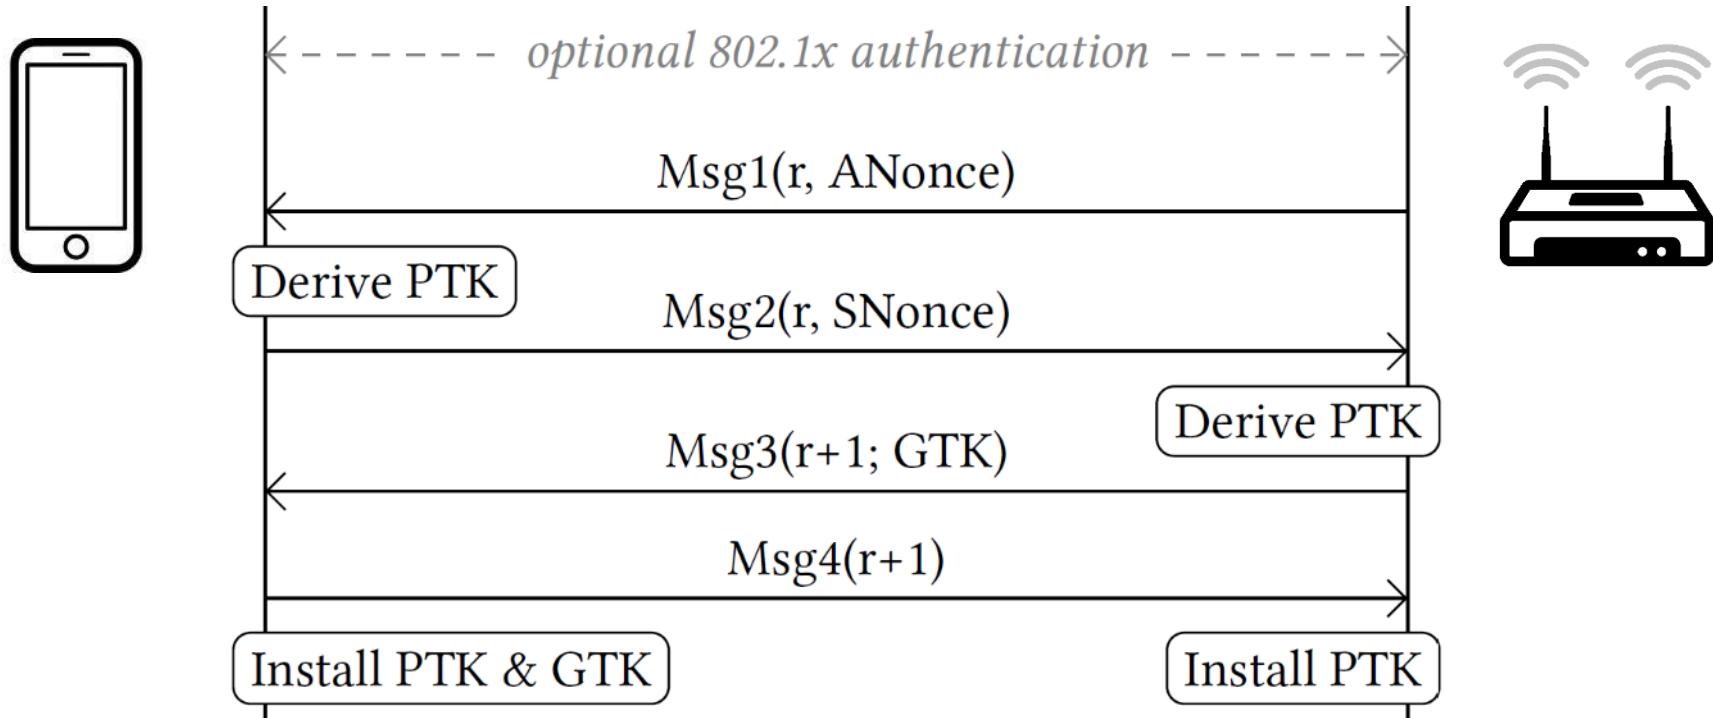

4-way handshake (simplified)

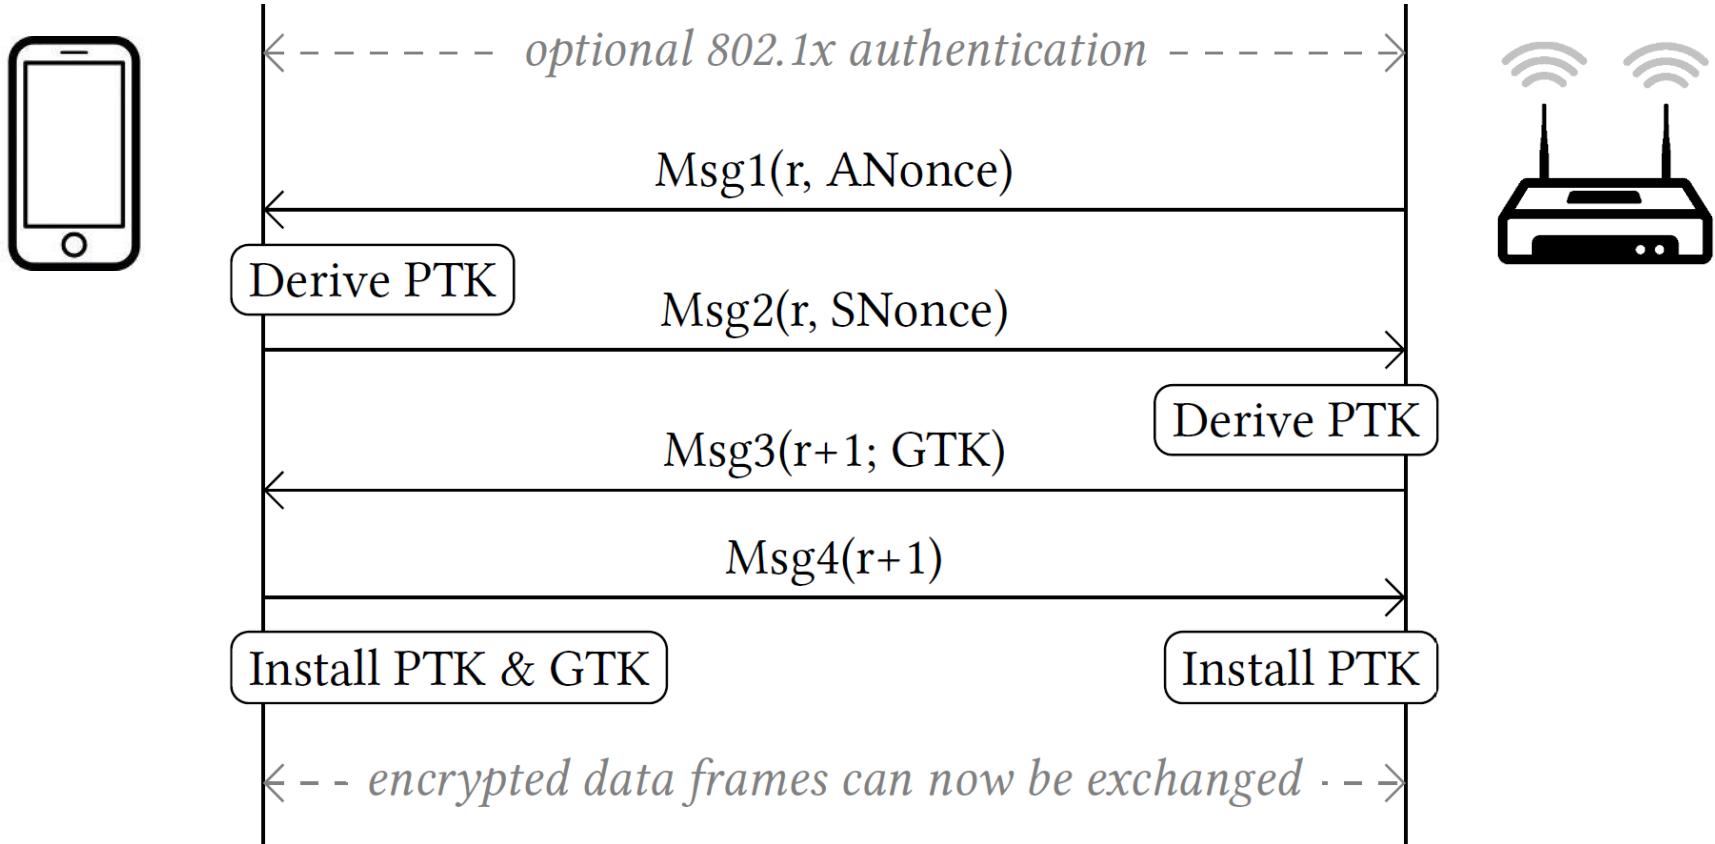

4-way handshake (simplified)

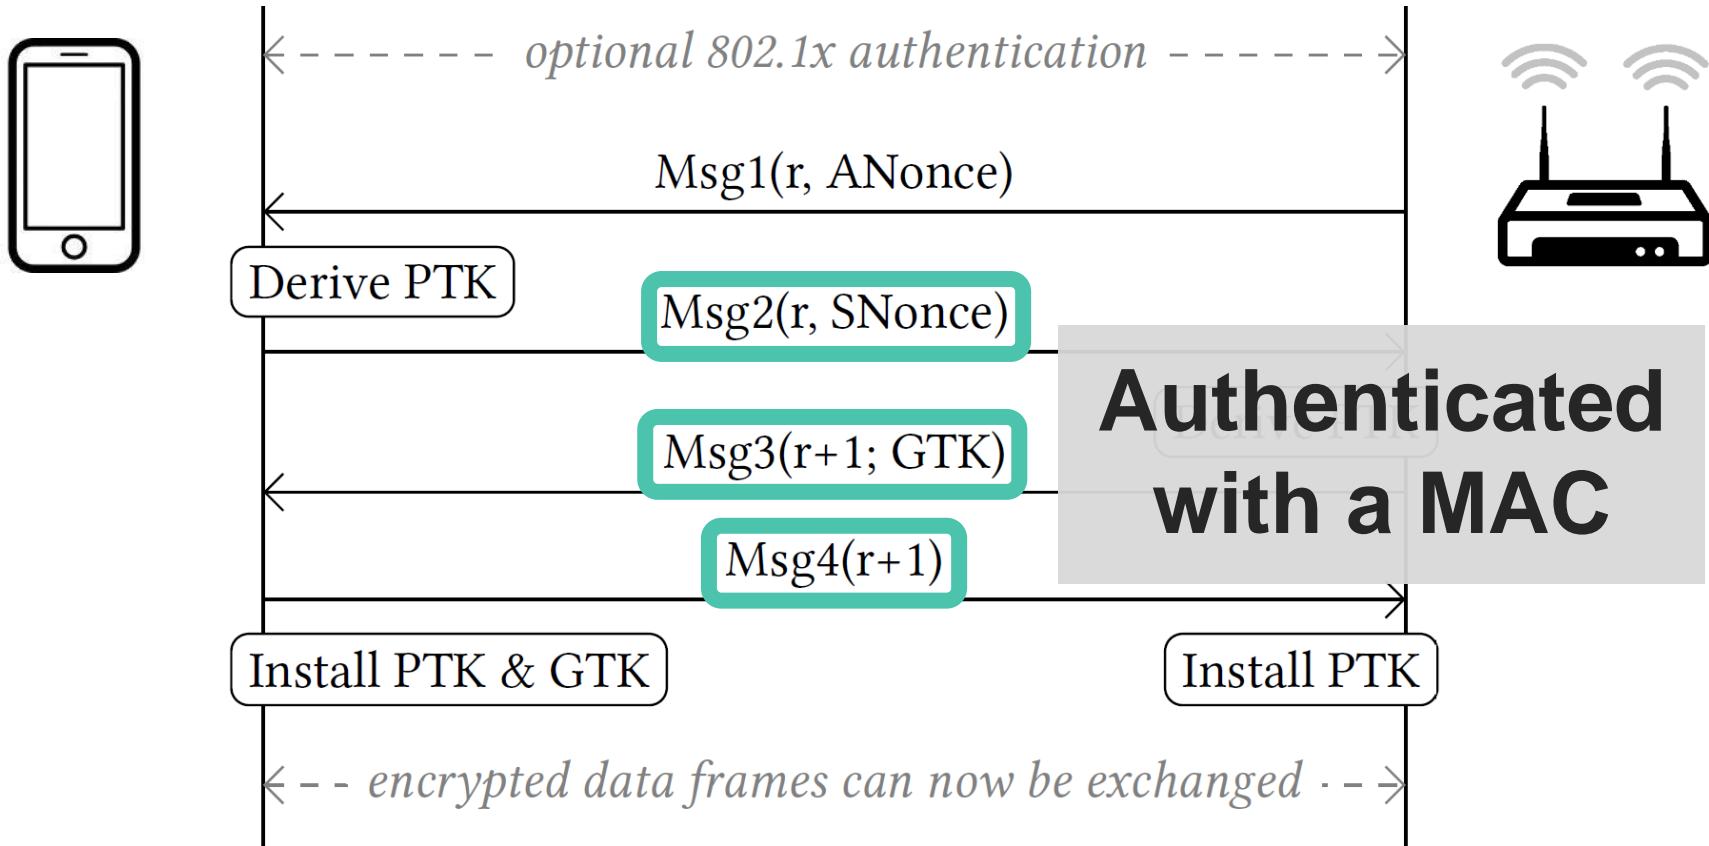

4-way handshake (simplified)

4-way handshake (simplified)

4-way handshake (simplified)

We focus on the client

Symbolic execution of

Intel's iwd deamon

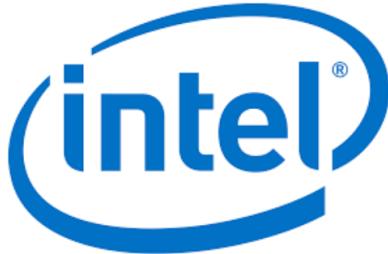

wpa_supplicant

kernel driver

How to get these working under KLEE?

Intel's iwd

Avoid running full program under KLEE

- › Would need to model Wi-Fi stack symbolically

Our approach

- › iwd contains unit test for the 4-way handshake
- › Reuse initialization code of unit test!
- › Symbolically execute only receive function

wpa_supplicant

Unit test uses virtual Wi-Fi interface

- › Would again need to simulate Wi-Fi stack...

Alternative approach:

- › Write unit test that isolates 4-way handshake like iwd
- › Then symbolically execute receive function!
- › Need to modify code of wpa_supplicant (non-trivial)

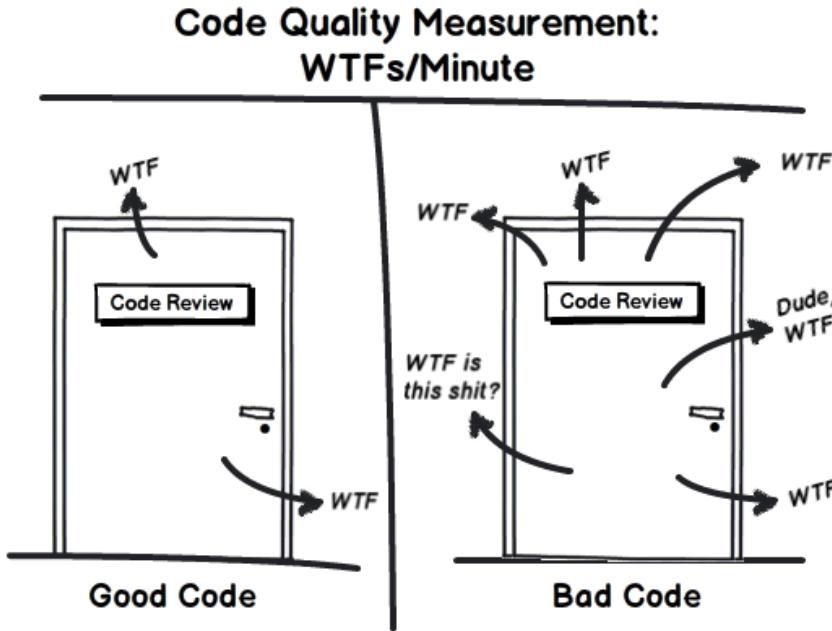

No unit tests & it's a Linux driver

- › Symbolically executing the Linux kernel?!

Inspired by previous cases

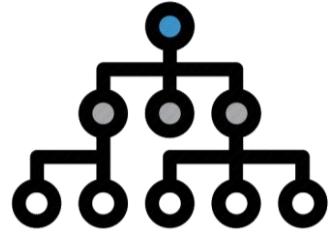

- › Write unit test & simulate used kernel functions in userspace
- › Verify that code is correctly simulated in userspace
- › Again symbolically execute receive function!

Not all our unit tests have clean code

<https://github.com/vanhoefm/woot2018>

Overview

Symbolic Execution

4-way handshake

Handling Crypto

Results

Discovered Bugs |

Timing side-channels

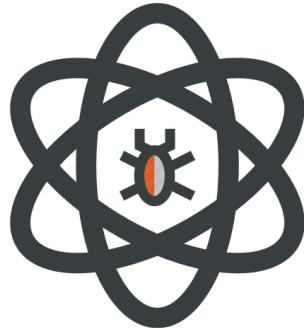

- › Authenticity tag not checked in constant time
- › MediaTek and iwd are vulnerable

Denial-of-service in iwd

- › Caused by integer underflow
- › Leads to huge malloc that fails

Discovered Bugs II

Buffer overflow in MediaTek kernel module

- › Occurs when copying the group key
- › **Remote code execution (details follow)**

Flawed AES unwrap crypto primitive

- › Also in MediaTek's kernel driver
- › **Manually discovered**

Decryption oracle in wpa_supplicant

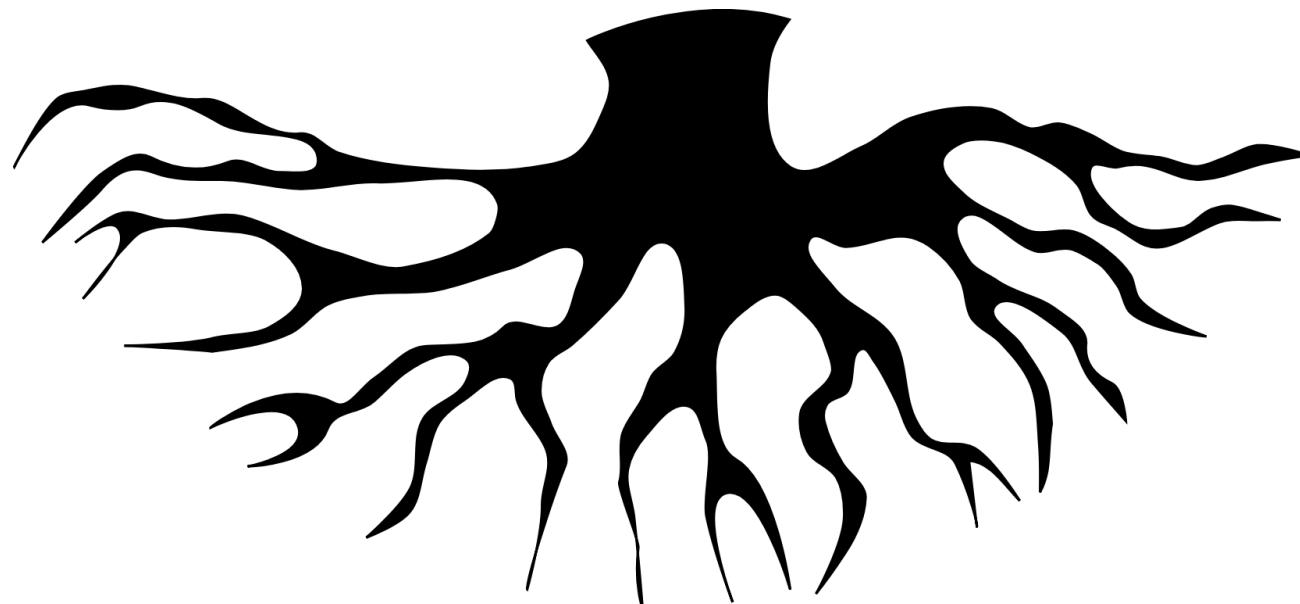

Decryption oracle:

- › Authenticity of Msg3 not checked
- › But **decrypts and processes data**

→ Decrypt group key in Msg3 (details follow)

Rooting Routers:

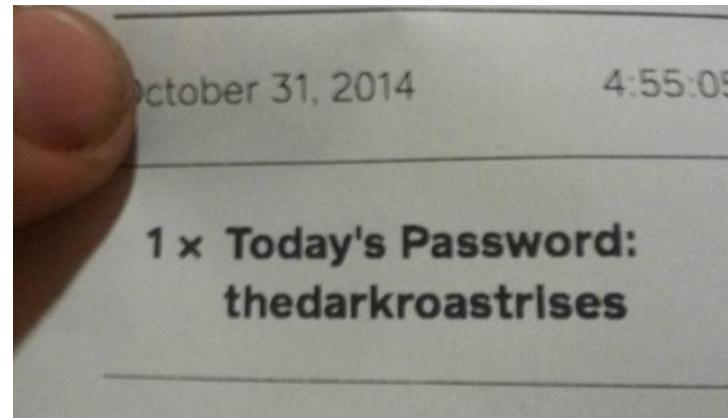

Buffer overflow in MediaTek kernel module

MediaTek buffer overflow preconditions I

Triggered when the **client** processes Msg3

- › Adversary needs password of network
- › Examples: Wi-Fi at conferences, hotels, etc.

MediaTek buffer overflow preconditions II

Which clients use the MediaTek driver?

- › Not part of Linux kernel source tree
- › **Used in repeater modes of routers**

Our target:

- › RT-AC51U running Padavan firmware
- › Original firmware has no WPA2 repeater

Popularity of Padavan firmware

Download repository	916.6 MB

We exploit this version

The vulnerable code (simplified)

```
void RMTPParseEapolKeyData(pKeyData, KeyDataLen, MsgType) {
    UCHAR GTK[MAX_LEN_GTK];

    if (MsgType == PAIR_MSG3 || MsgType == GROUP_MSG_1) {
        PKDE_HDR *pKDE = find_tlv(pKeyData, KeyDataLen, WPA2GTK);
        GTK_KDE *pKdeGtk = (GTK_KDE*)pKDE->octet;
        UCHAR GTKLEN = pKDE->Len - 6;
        NdisMoveMemory(GTK, pKdeGtk->GTK, GTKLEN);
    }

    APCliInstallSharedKey(GTK, GTKLEN);
}
```

The vulnerable code (simplified)

```
void RMTPParseEapolKeyData(pKeyData, KeyDataLen, MsgType) {
    UCHAR GTK[MAX_LEN_GTK];

    if (MsgType == PAIR_MSG3 || MsgType == GROUP_MSG_1) {
        PKDE_HDR *pKDE = find_tlv(pKeyData, KeyDataLen, WPA2GTK);
        GTK_KDE *pKdeGtk = (GTK_KDE*)pKDE->octet;
        UCHAR GTKLEN = pKDE->Len - 6;
        NdisMoveMemory(GTK, pKdeGtk->GTK, GTKLEN);
    }

    APCliInstallSharedKey(GTK, GTKLEN);
}
```

The vulnerable code (simplified)

```
void RMTPParseEapolKeyData(pKeyData, KeyDataLen, MsgType) {  
    UCHAR GTK[MAX_LEN_GTK];  
  
    if ((MsgType == DATA_MESSAGE) || (MsgType == GROUP_MESSAGE)) {  
        PLen controlled by attackerataLen, WPA2GTK);  
        GLen controlled by attacker;  
        UCHAR GTKLEN = pKDE->Len - 6;  
        NdisMoveMemory(GTK pKdeGtk->GTK, GTKLEN);  
  
        Destination buffer 32 bytes  
        APCInstallShareKey(GTK, GTKLEN);  
    }  
}
```

Main exploitation steps

- Code execution in kernel
- Obtain a process context
- Inject shellcode in process
- Run injected shellcode

Main exploitation steps

- **Code execution in kernel**
- Obtain a process context
- Inject shellcode in process
- Run injected shellcode

Gaining kernel code execution

How to control return address & where to return?

- › Kernel **doesn't use stack canaries**
- › Kernel stack has **no address randomization**
- › And the kernel stack is **executable**

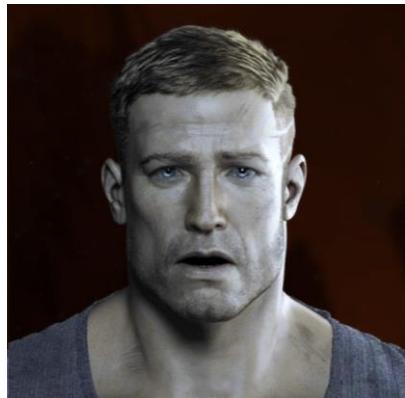

Return to shellcode on stack & done?

Gaining kernel code execution

How to control return address & where to return?

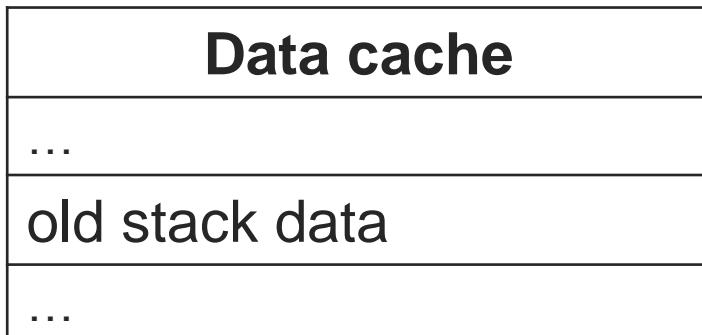

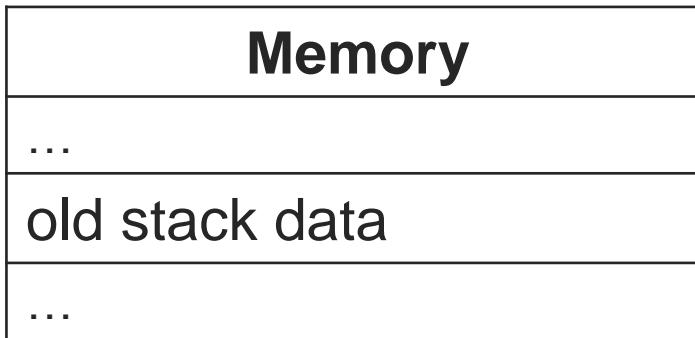

- › Kernel **doesn't use stack canaries**
- › Kernel stack has **no address randomization**
- › And the kernel stack is **executable**

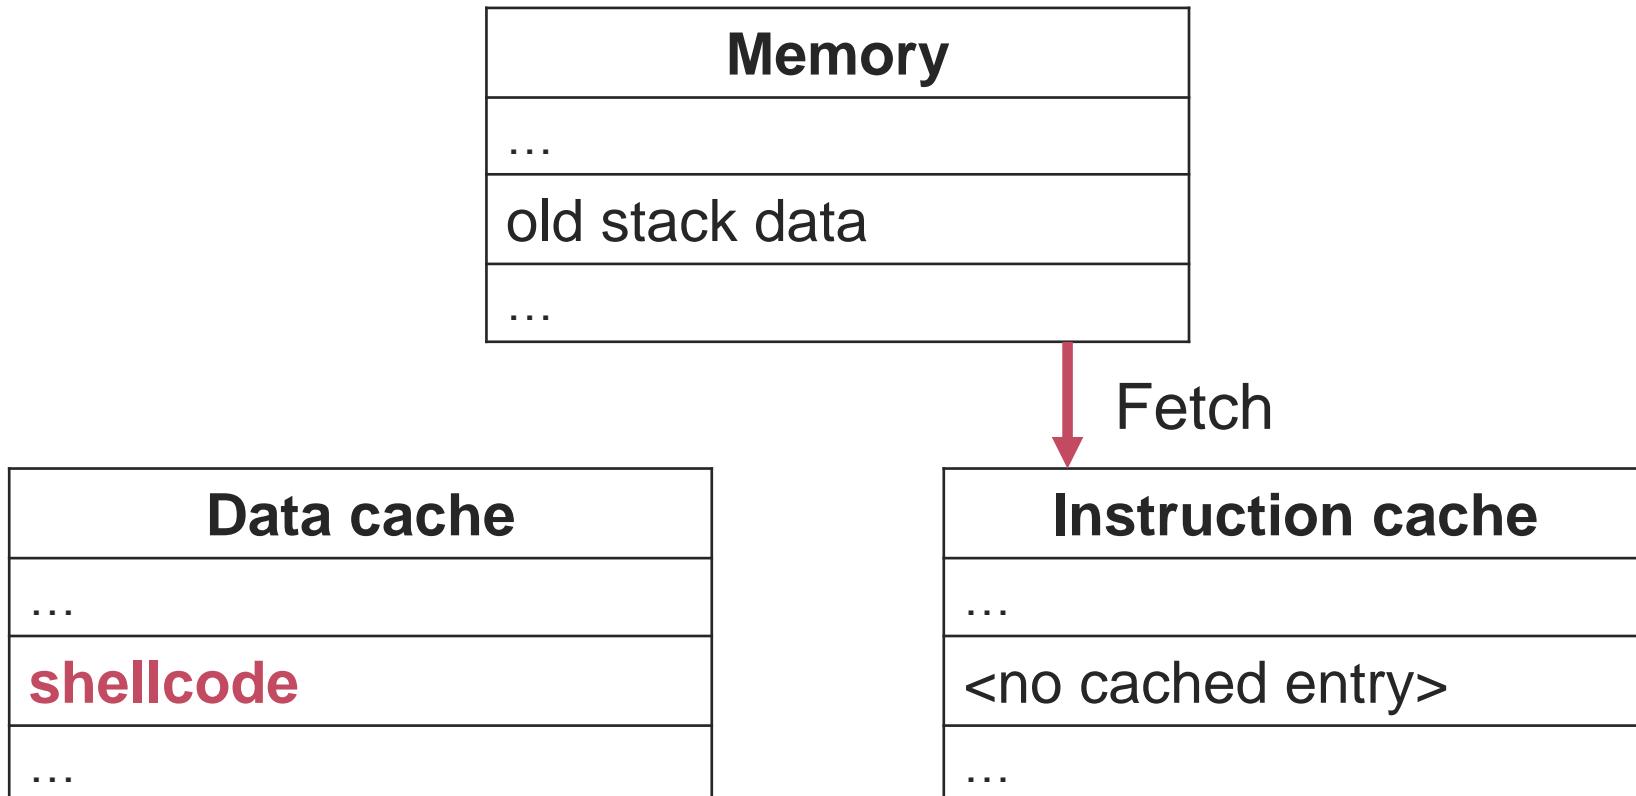

Return to shellcode on stack & done?

Nope... our shellcode crashes

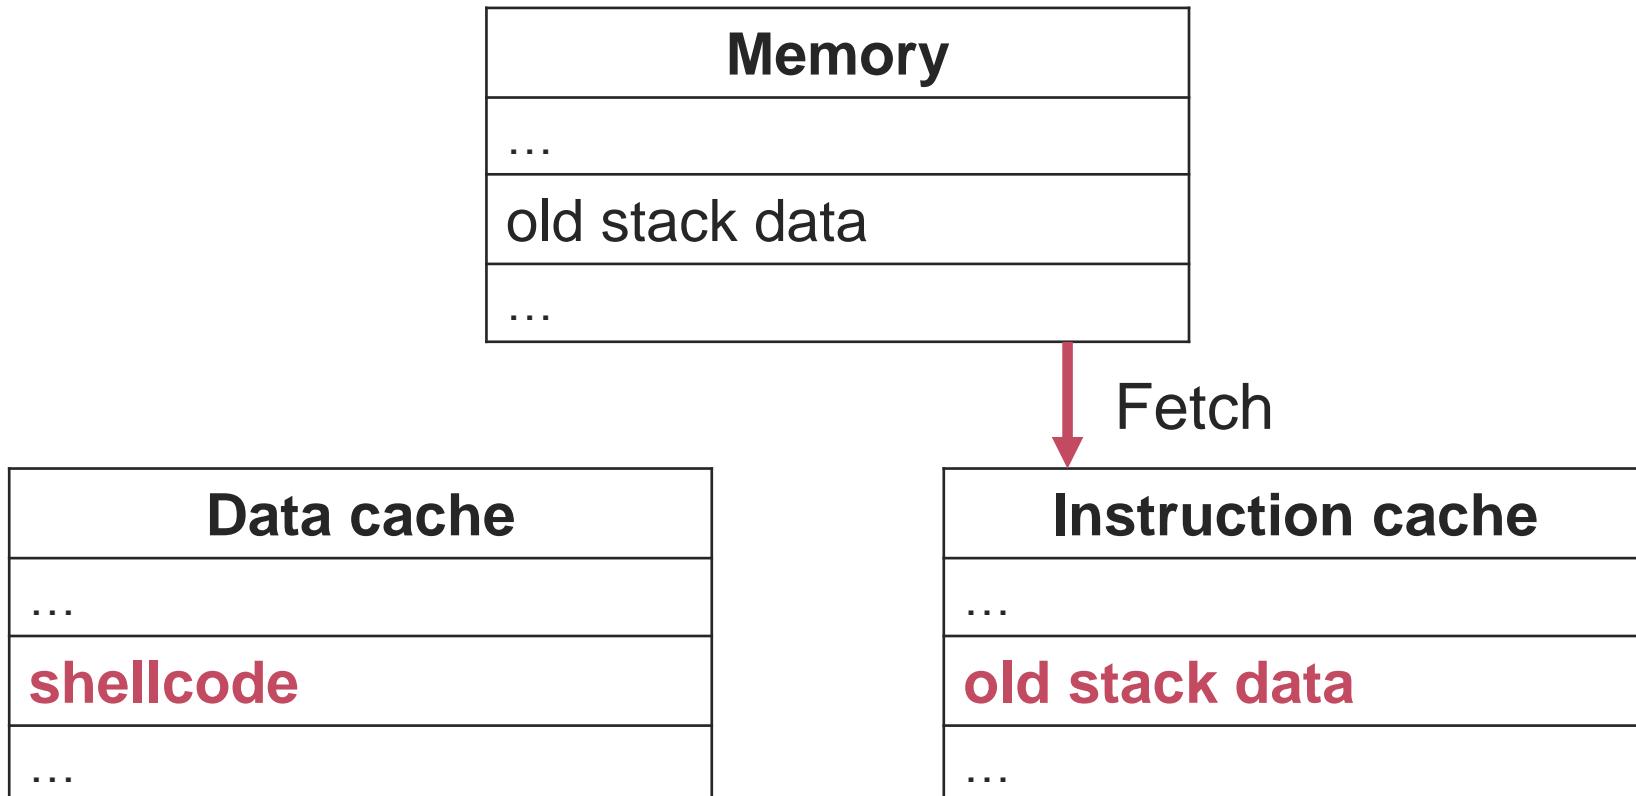

Problem: cache incoherency on MIPS

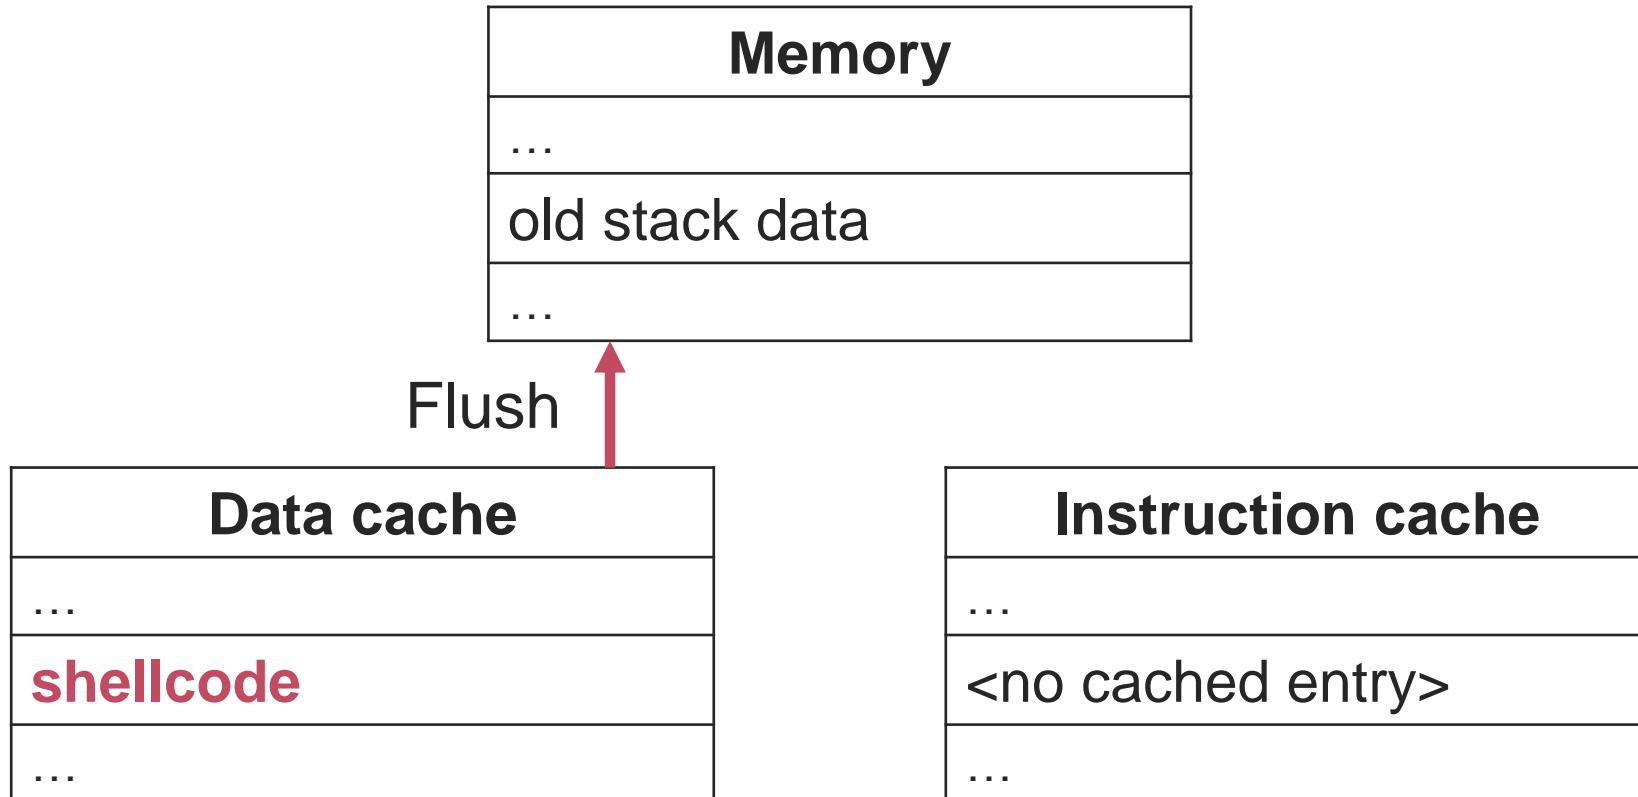

Problem: cache incoherency on MIPS

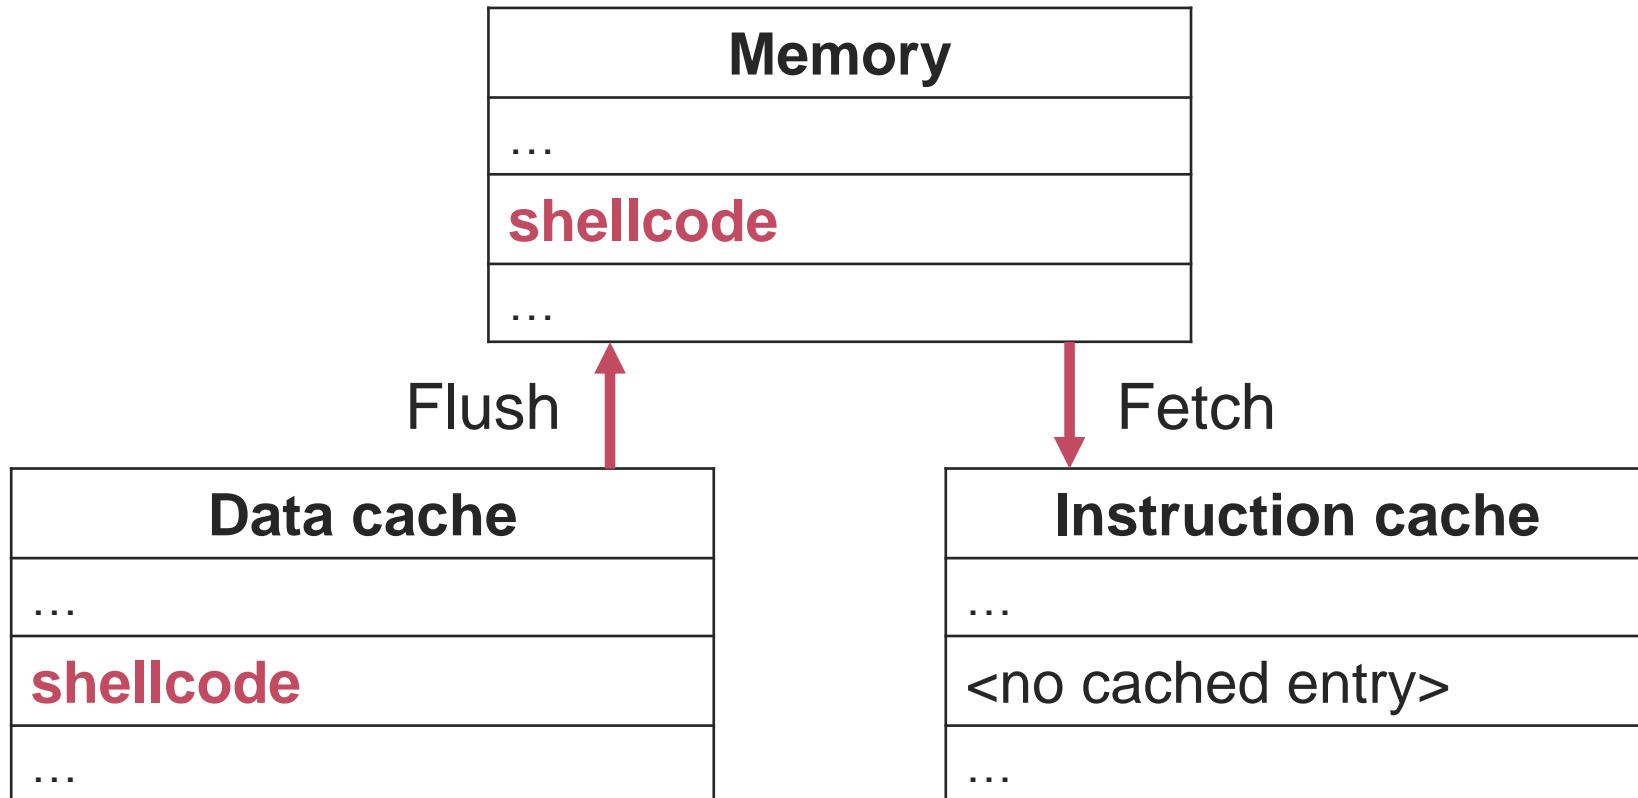

Problem: cache incoherency on MIPS

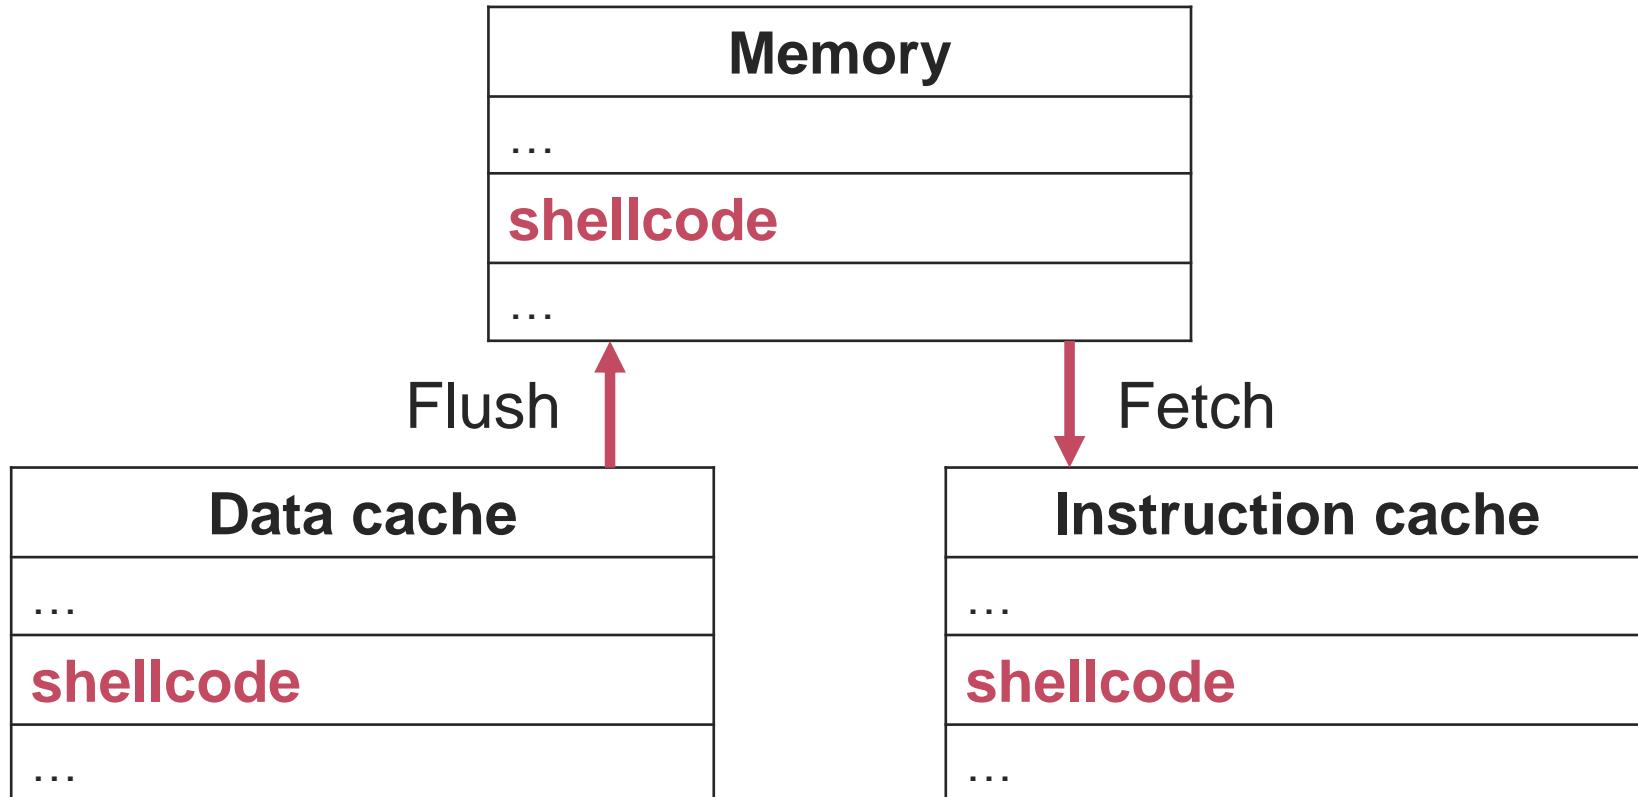

Solution: flush cache after write

Solution: flush cache after write

Solution: flush cache after write

How to flush the cache?

Execute kernel function to flush cache

- › Rely on Return Oriented Programming (ROP)
- › Use mipsrop tool of Craig Heffner

```
MIPS ROP Finder activated, found 1292 controllable jumps between 0x00000000 and 0x00078FE8
Python>mipsrop.tails()
```

Address	Action	Control Jump
0x0005E99C	move \$t9,\$a2	jr \$a2
0x00061858	move \$t9,\$a2	jr \$a2
0x00062D68	move \$t9,\$a2	jr \$a2

```
Found 3 matching gadgets
```

→ Building ROP chain is **tedious but doable**

Main exploitation steps

- Code execution in kernel
- **Obtain a process context**
- Inject shellcode in process
- Run injected shellcode

Obtaining a process context

Code execution in kernel, let's spawn a shell?

- › Tricky when in interrupt context
- › Easier in process context: access to address space

How to obtain a process context?

- › System calls run in process context ...
- › ... so intercept a close() system call

Intercepting system calls

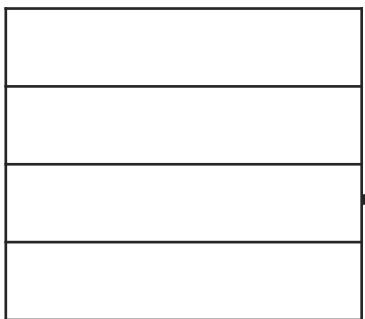

System call table:

sys_open

sys_read

sys_close

...

Intercepting system calls

System call table:

sys_open
sys_read
sys_close
...

Interceptor

attackers code
Jump to sys_close

sys_close

normal code

Main exploitation steps

- Code execution in kernel
- Obtain a process context
- **Inject shellcode in process**
- Run injected shellcode

Hijacking a process

Kernel now executes in process context

- › Hijack unimportant detect_link process
- › Recognize by its predictable PID

Now easy to inject shellcode in process:

1. Call **mprotect** to mark process code writable
2. **Copy user space shellcode** to return address
3. **Flush caches**

Main exploitation steps

- Code execution in kernel
- Obtain a process context
- Inject shellcode in process
- **Run injected shellcode**

User space shellcode

When close() returns, shellcode is triggered

- › It runs “**telnetd -p 1337 -l /bin/sh**” using execve
- › Adversary can now connect to router

Important remarks:

- › Original process is killed, but causes no problems
- › Used telnetd to keep shellcode small

Running the full exploit

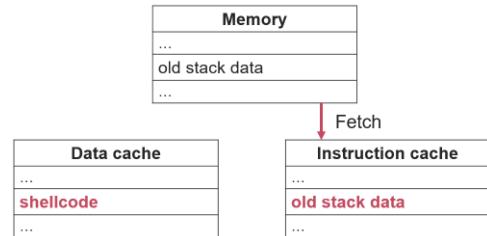

Multi-chain exploit. Space for shellcode?

- › For initial stage we have 250 bytes
- › Handshake frame can transport ~2048 bytes
- › We can even use null bytes!

```
BusyBox v1.24.1 (2016-02-01 01:51:01 KRAT) built-in shell (ash)
Enter 'help' for a list of built-in commands.
```

```
/home/root # uname -a
uname -a
Linux RT-AC51U 3.4.110 #1 Mon Feb 1 02:10:25 KRAT 2016 mips GNU/Linux
```

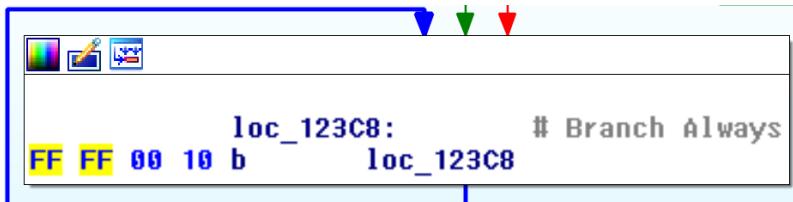

Exploit recap & lessons learned

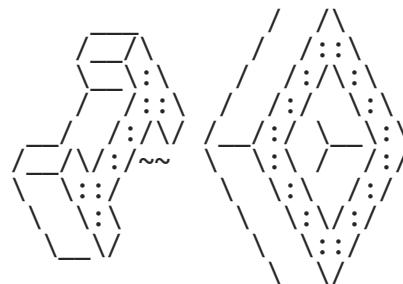

Cache incoherence

```
idx = __NR_close - __NR_Linux;  
real_close = (void*)*(sys_call_table +  
*(sys_call_table + idx * 2) = (unsigned  
flush_data_cache_page(sys_call_table +  
printk("real_close = %p\n", real_close)
```

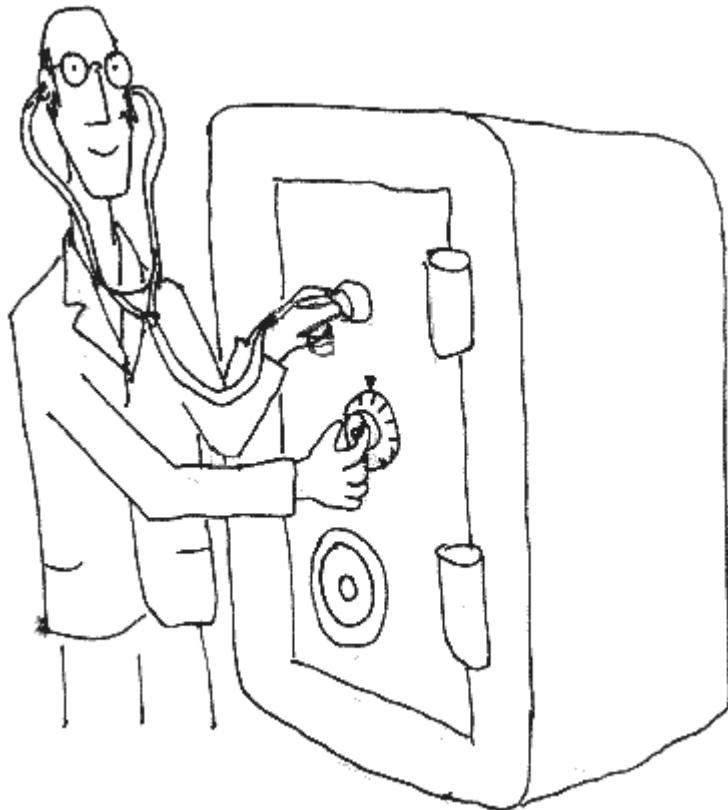

First test ideas in C

Debug with infinite loops

io.netgarage.org

Decryption Oracle

Recall: decryption oracle in wpa_supplicant

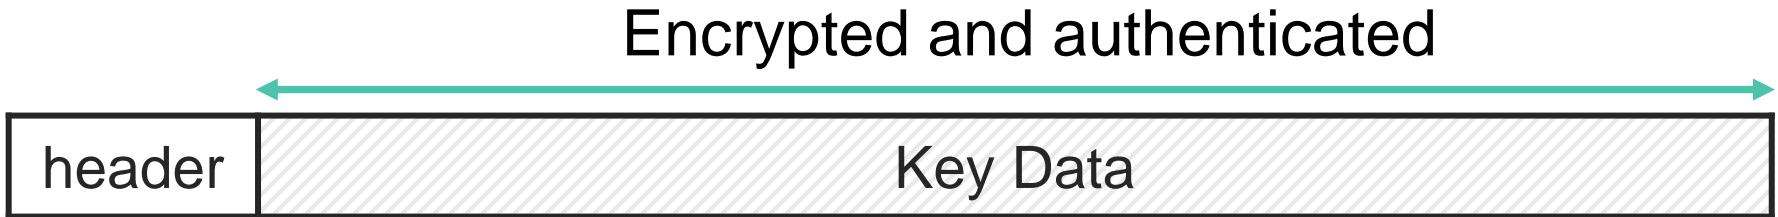

Decryption oracle:

- › Authenticity of Msg3 not checked
- › Does **decrypt and process data**

How can this be abused to leak data?

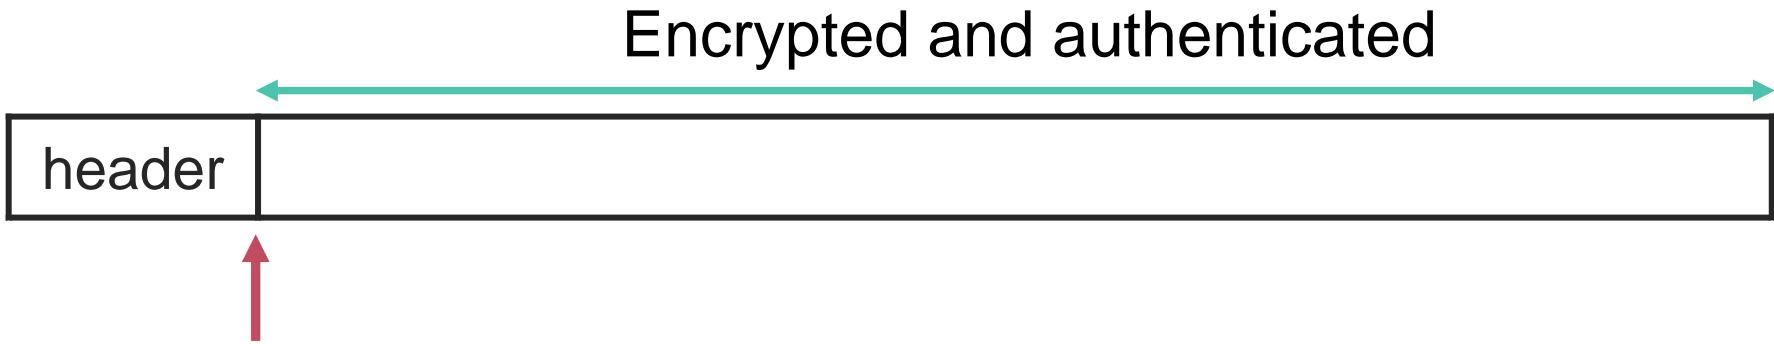

Background: process ordinary Msg3

On reception of Msg3 the receiver:

1. Decrypts the Key Data field

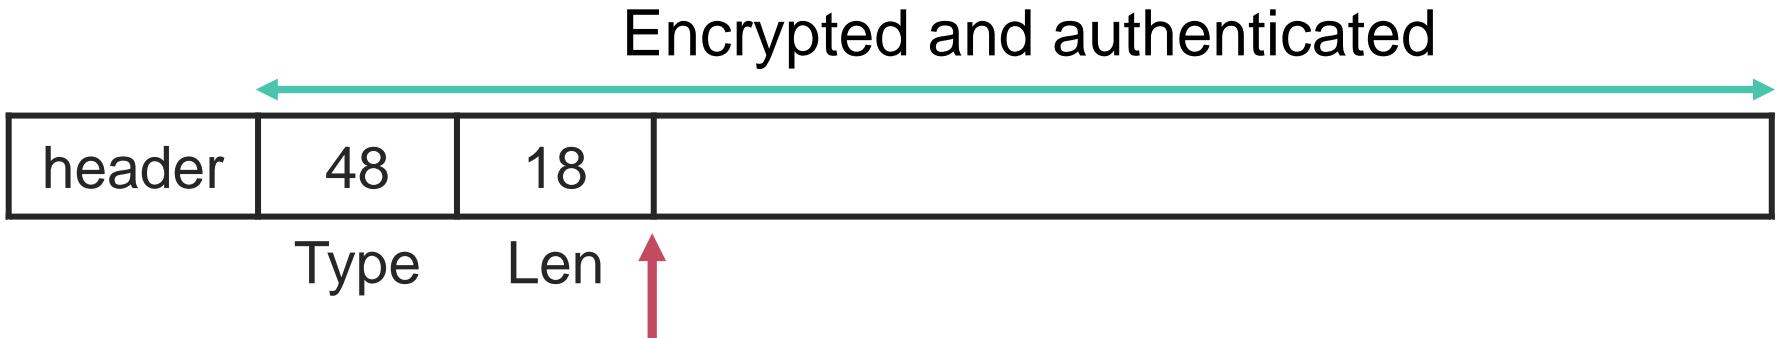

Background: process ordinary Msg3

On reception of Msg3 the receiver:

1. Decrypts the Key Data field
2. Parses the type-length-values elements

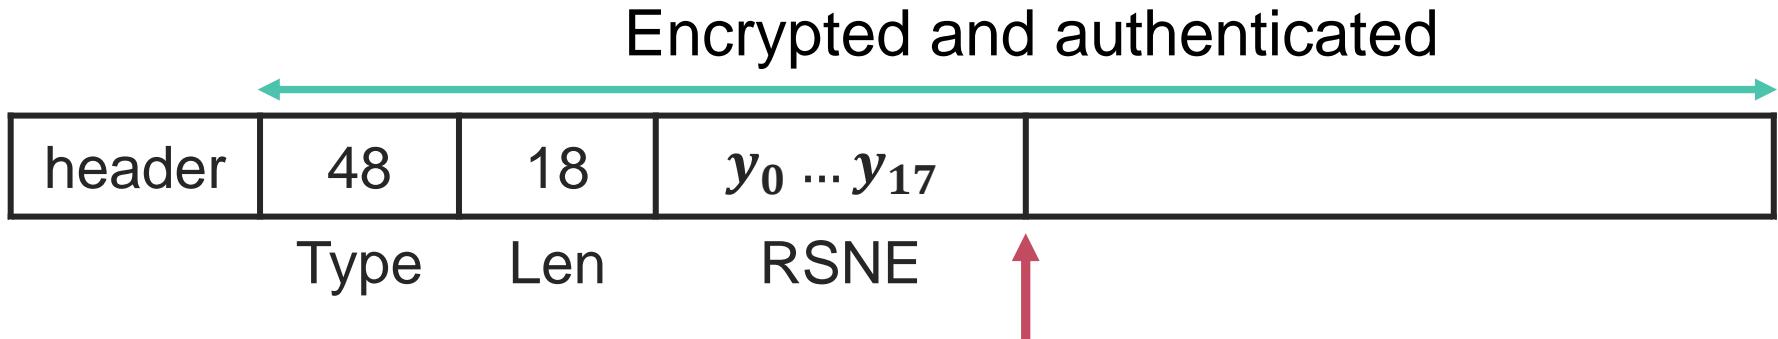

Background: process ordinary Msg3

On reception of Msg3 the receiver:

1. Decrypts the Key Data field
2. Parses the type-length-values elements

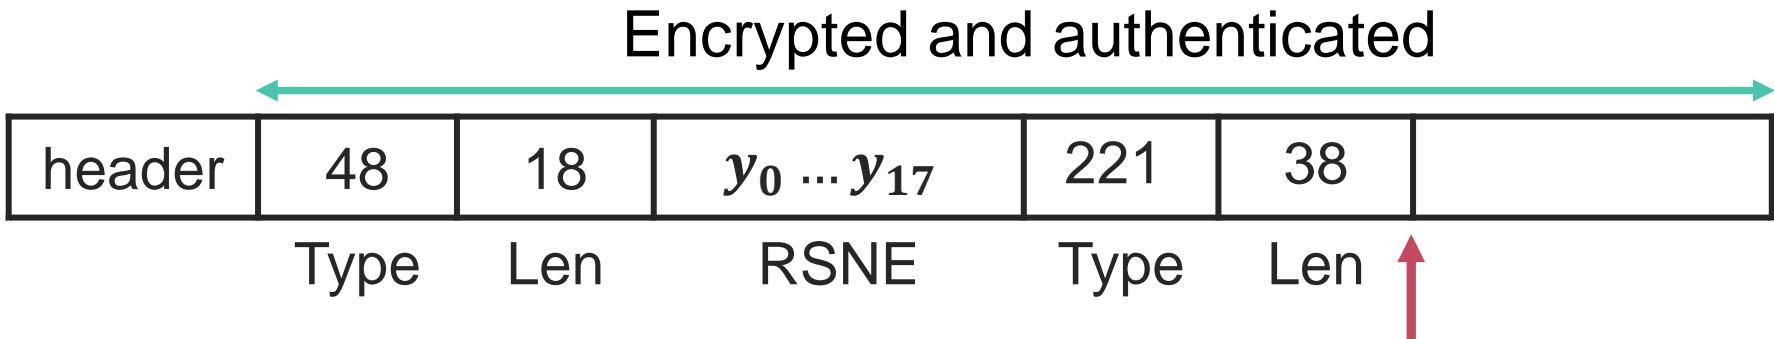

Background: process ordinary Msg3

On reception of Msg3 the receiver:

1. Decrypts the Key Data field
2. Parses the type-length-values elements

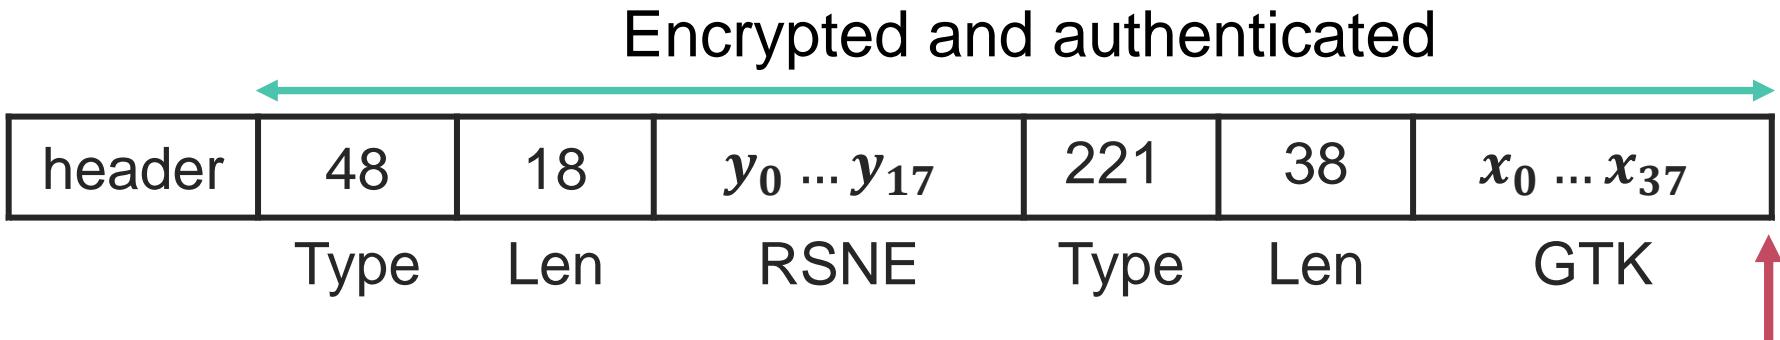

Background: process ordinary Msg3

On reception of Msg3 the receiver:

1. Decrypts the Key Data field
2. Parses the type-length-values elements

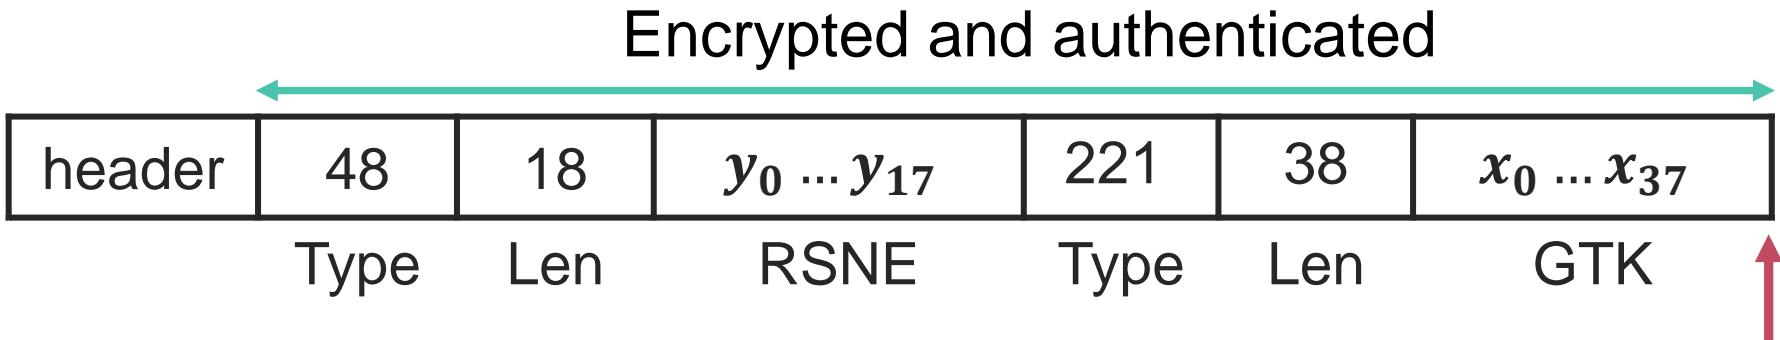

Background: process ordinary Msg3

On reception of Msg3 the receiver:

1. Decrypts the Key Data field
2. Parses the type-length-values elements

Background: process ordinary Msg3

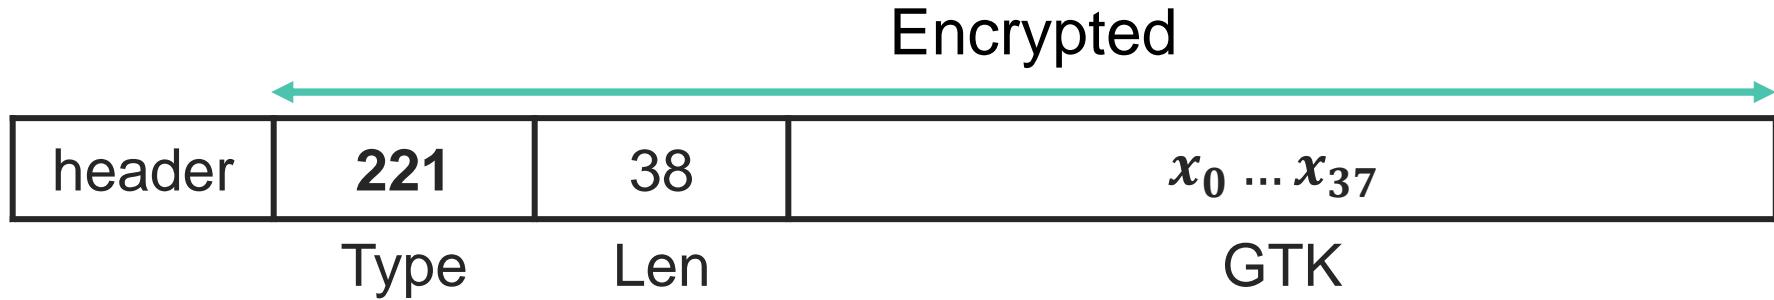

On reception of Msg3 the receiver:

1. Decrypts the Key Data field
2. Parses the type-length-values elements
3. Extracts and installs the group key (GTK)

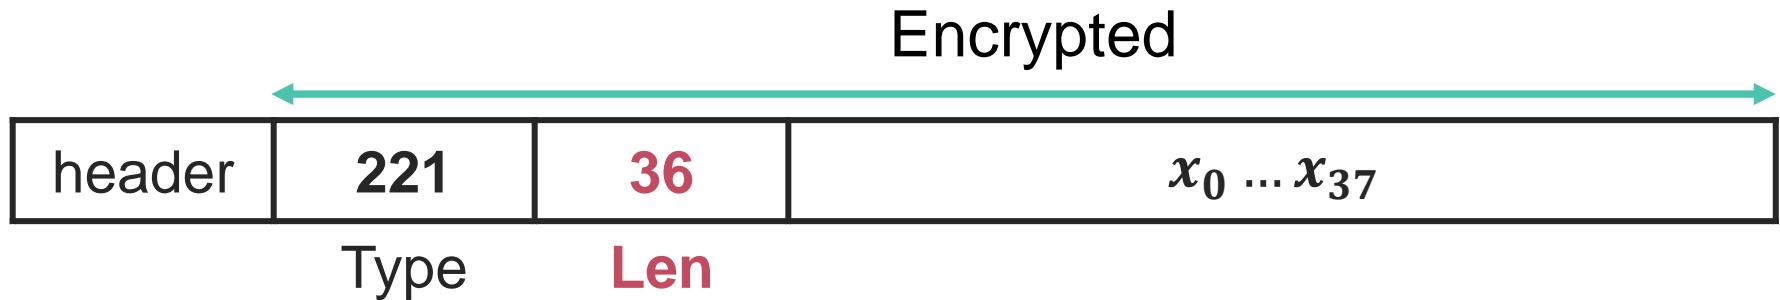

How to turn parsing into an oracle?

Constructing an oracle

Adversary knows type and length, but not GTK

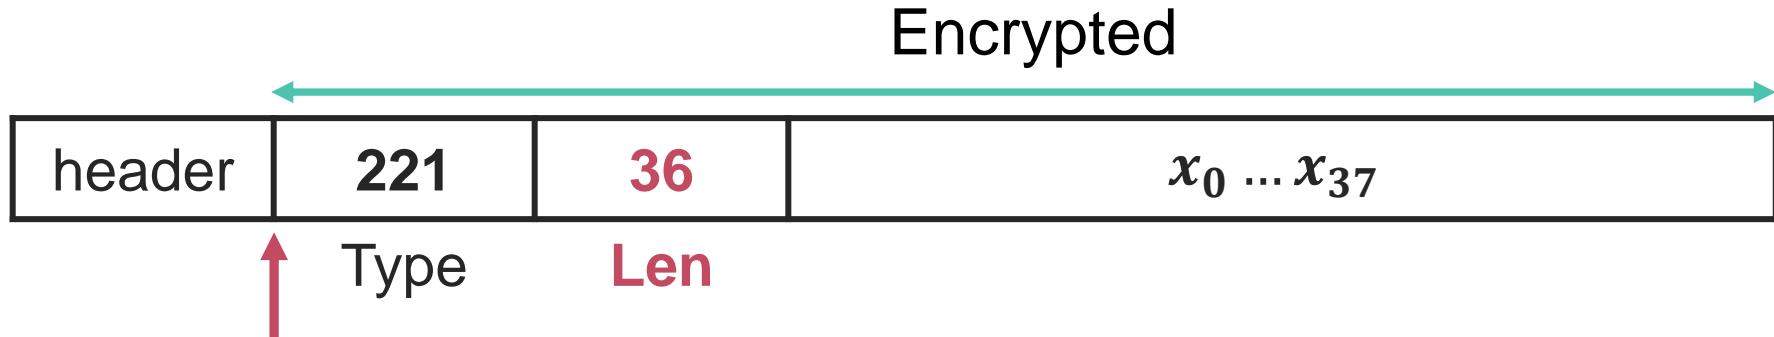

Constructing an oracle

Adversary knows type and length, but not GTK.

1. Reduce length by two

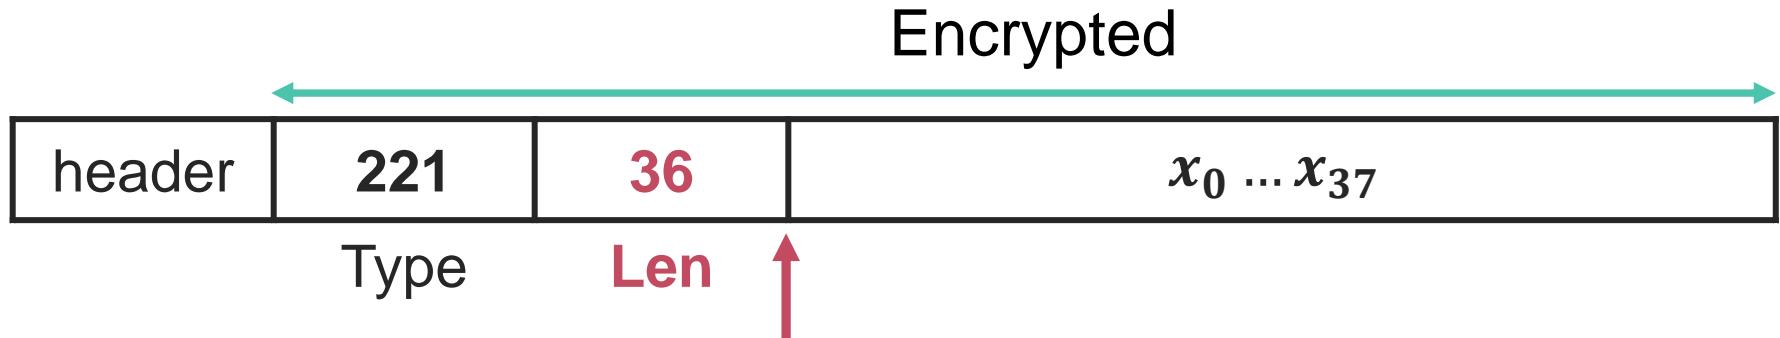

Constructing an oracle

Adversary knows type and length, but not GTK.

1. Reduce length by two
2. Parsing

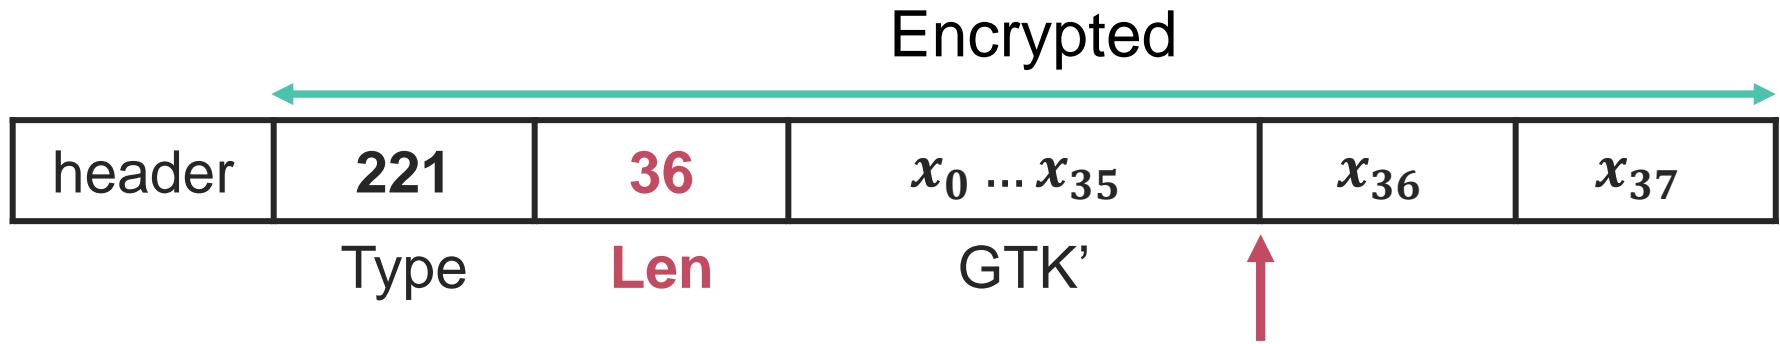

Constructing an oracle

Adversary knows type and length, but not GTK.

1. Reduce length by two
2. Parsing

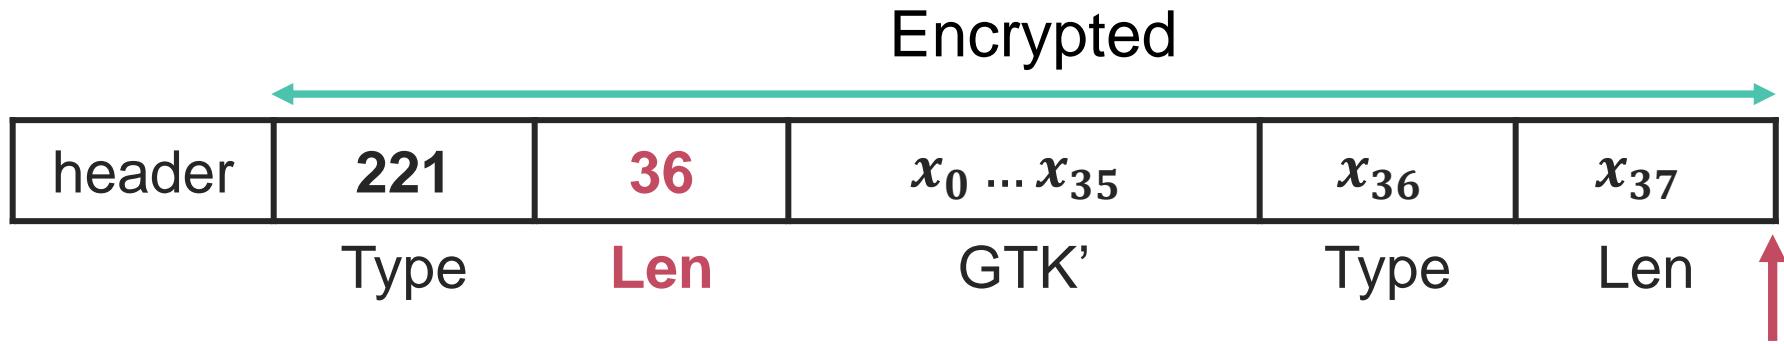

Constructing an oracle

Adversary knows type and length, but not GTK.

1. Reduce length by two
2. Parsing

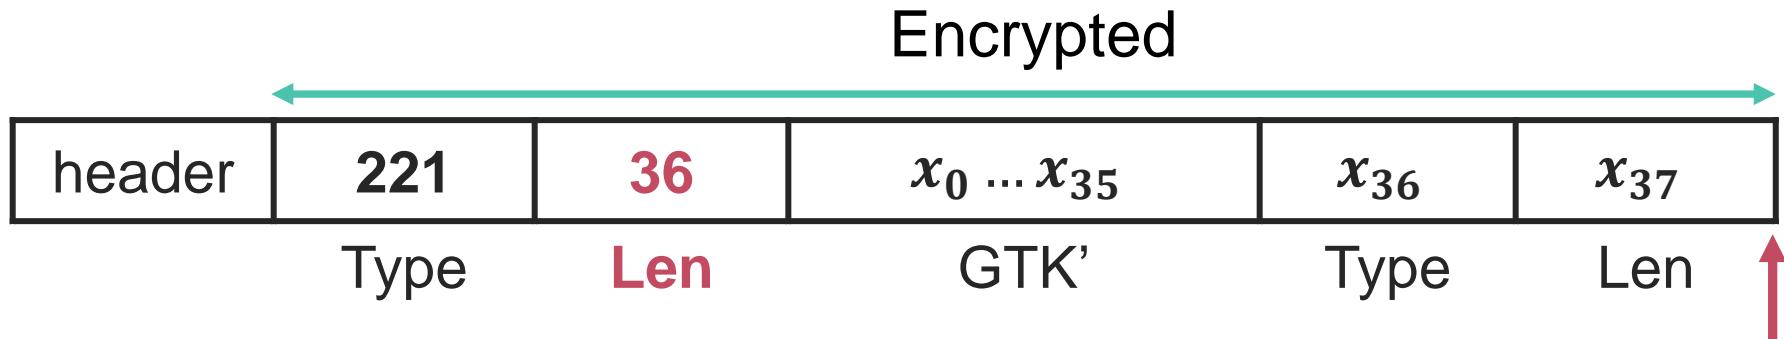

Constructing an oracle

Adversary knows type and length, but not GTK.

1. Reduce length by two
2. Parsing only succeeds if x_{37} equals zero

Constructing an oracle

Adversary knows type and length, but not GTK.

1. Reduce length by two
2. **Parsing only succeeds if x_{37} equals zero**
3. Keep flipping encrypted x_{37} until parsing succeeds

Abusing the oracle in practice

1. Guess the last byte (in our example x_{37})
 2. XOR the ciphertext with the guessed value
 3. **Correct guess:** decryption of x_{37} is zero
 - » **Parsing succeeds & we get a reply**
 4. Wrong guess: decryption of x_{37} is non-zero
 - » Parsing fails, no reply
- Keep guessing last byte until parsing succeeds

Practical aspects

Test against Debian 8 client:

- › Adversary can guess a value every 14 seconds
- › Decrypting 16-byte group key takes ~8 hours

Attack can be made faster by:

- › Attacking several clients simultaneously
- › Can brute-force the last 4 bytes

The big picture

I wrote a vulnerability scanner that abstracts all the predicates in a binary, traverses the callgraph and generates phormulaes to run them with a SMT solver.
I found 1 vuln in 3 days with this tool.

He wrote a dumb ass fuzzer and found 5 vulns in 1 day.

Good thing I'm not a n00b like that guy.

The big picture

I wrote a vulnerability scanner that abstracts all the predicates in a binary, traverses the callgraph and generates formulas to run them with SMT solvers. I found 1 vuln in 3 days with this tool.

Although limitations remain, symbolic execution tools are now more usable & efficient.

Future symbolic execution work

Short-term

- › Efficiently simulate reception of multiple packets
- › If 1st packet doesn't affect state, stop exploring this path

Long-term

- › Extract packet formats and state machine
- › Verify basic properties of protocol

Conclusion

- › Symbolic execution of protocols
- › Simple simulation of crypto
- › Root exploit & decryption oracle
- › Interesting future work

Thank you!
