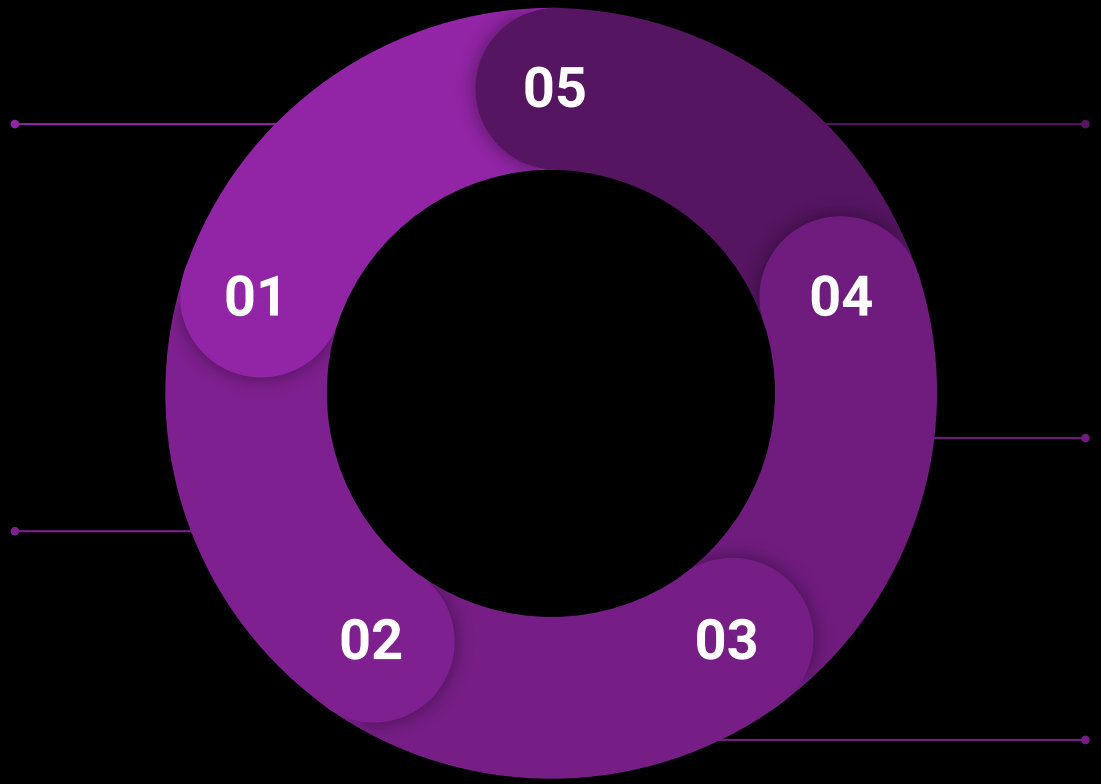
Internet of Radio Vulnerabilities

Rogue Cell Towers

Used to hijack cell phone connections, and to break 2-factor authentication to listen to calls and read texts.

Rogue Wi-Fi Hotspots

Impersonate legitimate Wi-Fi networks, and might be used for MITM attacks to sniff network traffic and steal credentials.



Vulnerable Wireless Devices

Low-end keyboard/mouse dongle can expose to RF attack through keystroke injection, which may expose the larger network to insider attacks.

Eavesdropping/ Surveillance Devices

Voice activated FM & GSM, or other radio bugs

Unapproved IoT Emitters

Sensors often have multiple data radios, 802.11 is known, but what if also transmitting on other frequencies like Zigbee, or LORA.

INTERNATIONAL / COMMENTARY

NATO Designates Cyber as Official Domain for Warfare

Anna Ferrara / David Inserra / @dr_inserra / June 29, 2016 /

Defending our territory and protecting our citizens is NATO's core mission.

We also turned our attention to cyberspace.

We agreed that we will recognise cyberspace as an operational domain.

Just like air, sea and land.

Cyber defence is part of collective defence.

Most crises and conflicts today have a cyber dimension.

So treating cyber as an operational domain would enable us to better protect our missions and operations.

A Brief History of EW

The Origins of Electronic Warfare

By Wing Commander M. T. THURBON, RAF (Retd)

Men who ignore the past are doomed to relive it.
Santayana

There is a widespread belief that Electronic Warfare (EW) originated early in World War II with the British jamming of the German blind bombing aids Knickebein, X-Gërat and Y-Gërat. In fact what is now called EW has a surprisingly long history and many of the earliest examples of its application still, I believe, hold important lessons for us today. Excellent accounts of the development of electronic warfare in World War II can be found in Alfred Price's books.[1,2] My aim is to retrace the evolution of this subject backwards from 1939.

1919–1939

The years between the two world wars saw many conflicts but the scope and nature of most of these precluded the use of EW. Perhaps only in the Spanish Civil War, a proving ground for a wide range of the most modern weapons of the day, were there opportunities for the limited application of counter-measures against communications, although the available references fail to reveal any such operations. This apparent lack of EW activity between 1918 and 1939 does not mean that the subject was completely forgotten. In Great Britain the designers of the early radar systems were, from the very beginning, keenly aware of the possibility of enemy counter-measures. As early as 9 September 1935, less than seven months after the feasibility of radar was first demonstrated, Sir Robert (then Mr) Watson-Watt, in a progress report to the Committee for the Scientific Study of Air Defence, proposed the establishment of what became known as the Chain Home system. His scheme included provision for minimising the effects of interference, especially deliberate jamming. Sir Robert suggested that planning should proceed on the assumption that the anti-jamming design would be effective but he recognised that this hope might be disappointed and that a means of rapidly changing wavelength might have to be provided, although this solution might be expensive. By 1937 the use of multiple wavelengths had become accepted. On 19 October 1935, he was asked by the Committee whether radio-location (as radar was then called) could be defeated by deliberate jamming. In reply Sir Robert defined the conditions that would have to be fulfilled if jamming were to be effective and he discussed the extent to which those conditions might be met by direct jamming from, for example, sites on the Belgian coast. He also considered the possibility of indirect jamming via the ionosphere (these early radars operated in the HF band). He concluded that provided the cover was limited to 0 to 30 degrees in elevation, jamming from ground stations in enemy territory could not defeat the system. It was recognised that airborne jamming could be effective but it was thought that the aircraft could be located by direction finding (DF) and, at least by day, intercepted by fighters. Other suggestions made at the time were for the provision of a reserve and secret frequency for each RDF station and the use of a narrow rotating beam scan. Such was the concern about the vulnerability of RDF to jamming that in 1937 a Jamming Section was set up at Bawdsey to provide various types of jamming to the Anti-Jamming Group and to conduct experiments to assess the effectiveness and probable use of these types of jamming. The work of this section "had the desired result of bringing out many anti-jamming suggestions". In 1938 ground and airborne jammers were used in trials against a number of RDF sites.[3]

ECCM

Work was also in progress elsewhere during this period. An interesting example, because it must be one of the earliest applications of electronic counter-counter measures (ECCM) to a weapon system, occurred in Germany. In 1916 a German, Franz Drexler, had unsuccessfully attempted to convince the authorities of the case for unmanned aircraft controlled by a system of auto-pilot and radio control (the radio control of a model airship had been demonstrated by a German school teacher, Wirth, in 1913). In 1926 the German Army Air Staff was interested in unmanned aircraft for photographic reconnaissance and strategic bombing. Drexler resubmitted his idea and this time to a more receptive audience. Circumventing the terms of the Treaty of Versailles, which prohibited the Germans from operating unmanned aircraft but which said nothing about research, Drexler and a radio expert Max Diekmann, were set to work on the design of a guided missile. Their preferred solution appears to have been a form of command guidance and someone, probably Diekmann, showed a remarkable awareness of the vulnerability of any radio link to jamming. The missile carried a "telemetry" device and signals were transmitted to a control post having two spaced aerial systems with goniometers. The instantaneous position of the vehicle was continuously indicated on a map and the loop must have been closed by a ground transmitter. The problems of protecting the radio signals from jamming had been given much thought throughout and a chain of what were described as selective traps was interposed at both ends.[4] (A wave trap was a circuit placed in series with the aerial of the receiver so as to reject strong interfering signals.) By using a chain of these traps Diekmann ensured that any jammer would

Electronic Warfare (EW)

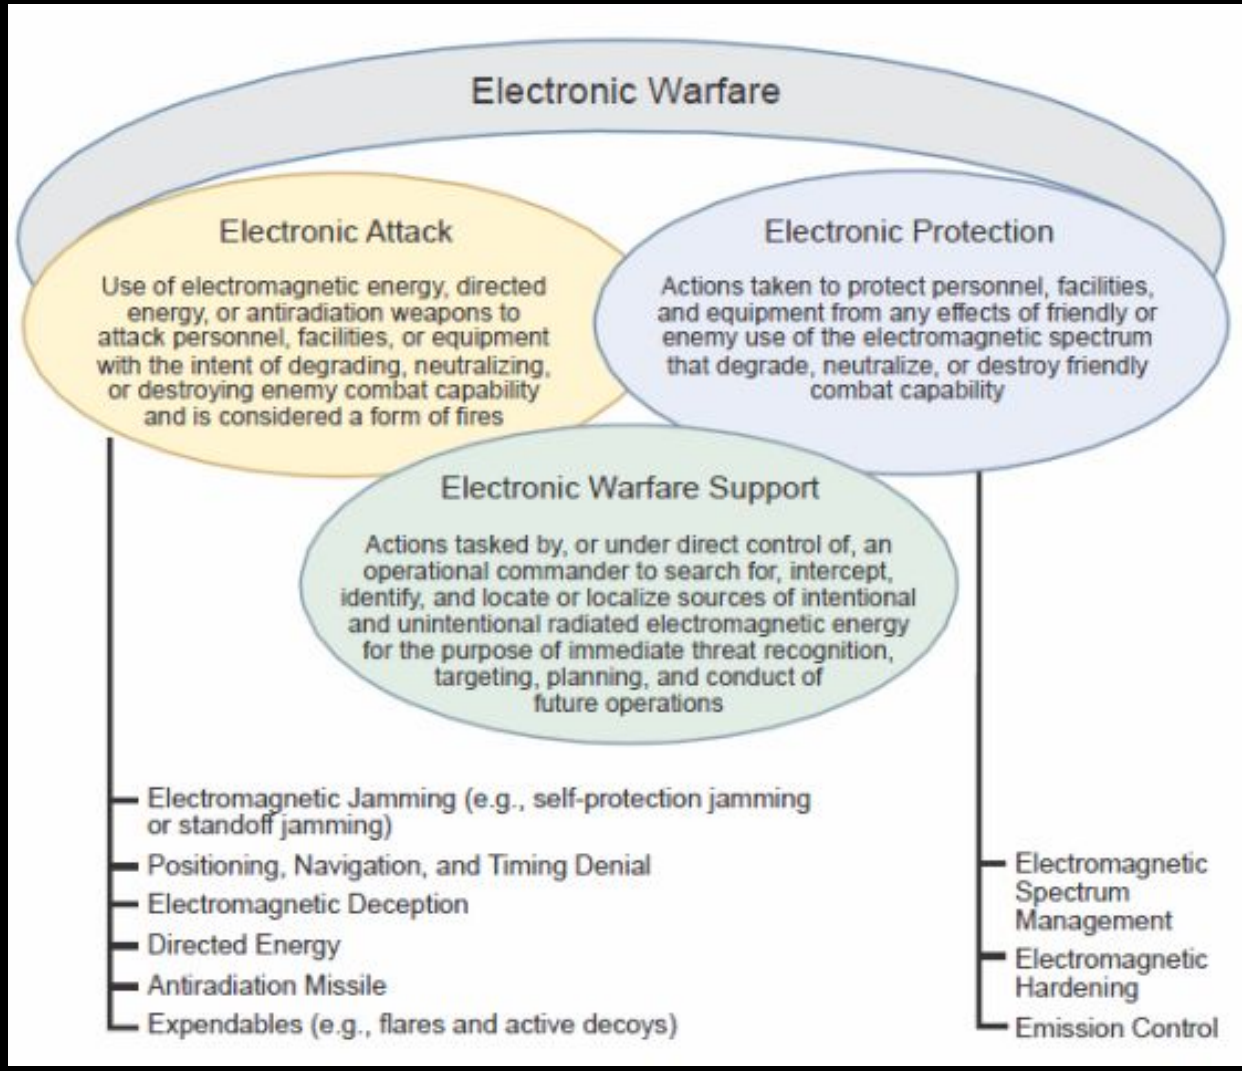
the ability to use the electromagnetic spectrum signals such as radio, infrared or radar to sense , protect , and communicate

Electronic Warfare

Electronic Warfare: is military action using electromagnetic and directed energy to control the electromagnetic spectrum or at attack the enemy (JP 3-51/FM 3-13).

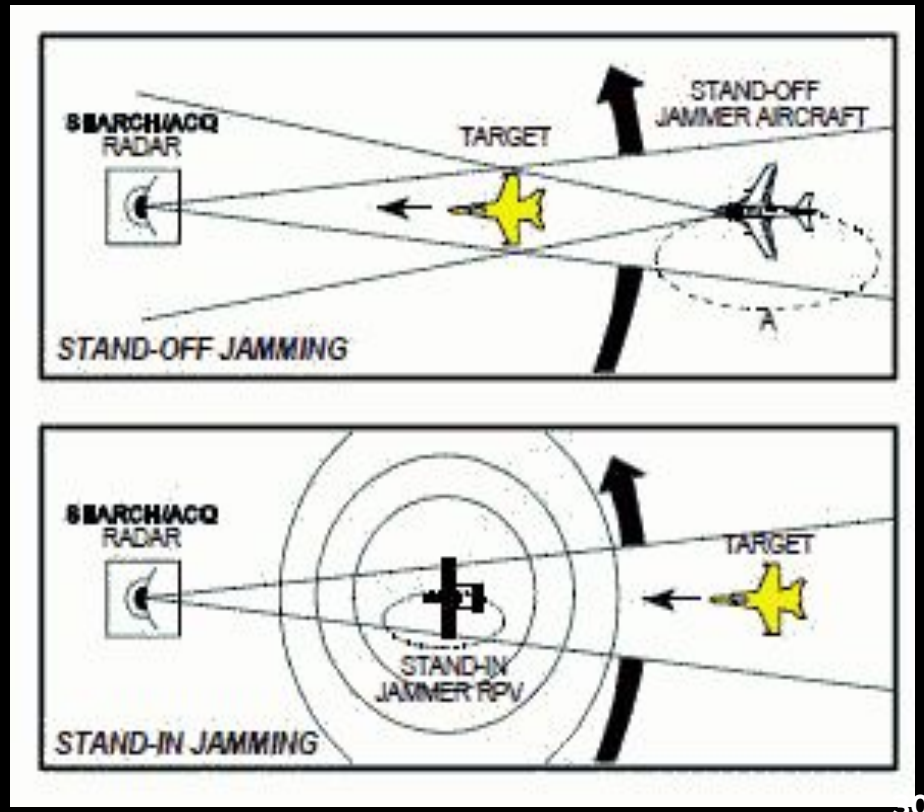
The three major subdivisions of EW are:

- Electronic Warfare Support (ES) *ESM
- Electronic Attack (EA) *ECM
  Electronic Protect (EP) *ECCM



Electronic Attack (EA)

- Passive surveillance of the EM spectrum to detect the enemy's position, strength, and intention, and warning of targets
- Preventing or reducing the enemy's use of the EM spectrum (capabilities) and promoting uncertainty
- "Black boxes" that jam or deceive the enemy
- Radar or communications "jamming"



Electronic Protection (EP)

- Protection of friendly combat capability against undesirable effect of friendly or enemy employed EW
- Types
  –Passive EW
  –Active EW
- Three ways to defend from enemy
  –Modify radar
    - Make it more complex
    - Make it harder to jam
  –Modify the Medium
    - Chaff
    - Torch
  –Modify the platform

ELECTRONIC PROTECTION (EP) TECHNIQUES

Angular Resolution	Compressive IF Amplifier	Jamming Cancellation Receiver	Pulse-To-Pulse Frequency Shift (RAINDOW)

±Burnthrough: Increase signal strength to overpower jammer noise (ECCM)

CYBER DEFENSE

Army electronic warfare technology attacks and disables tank

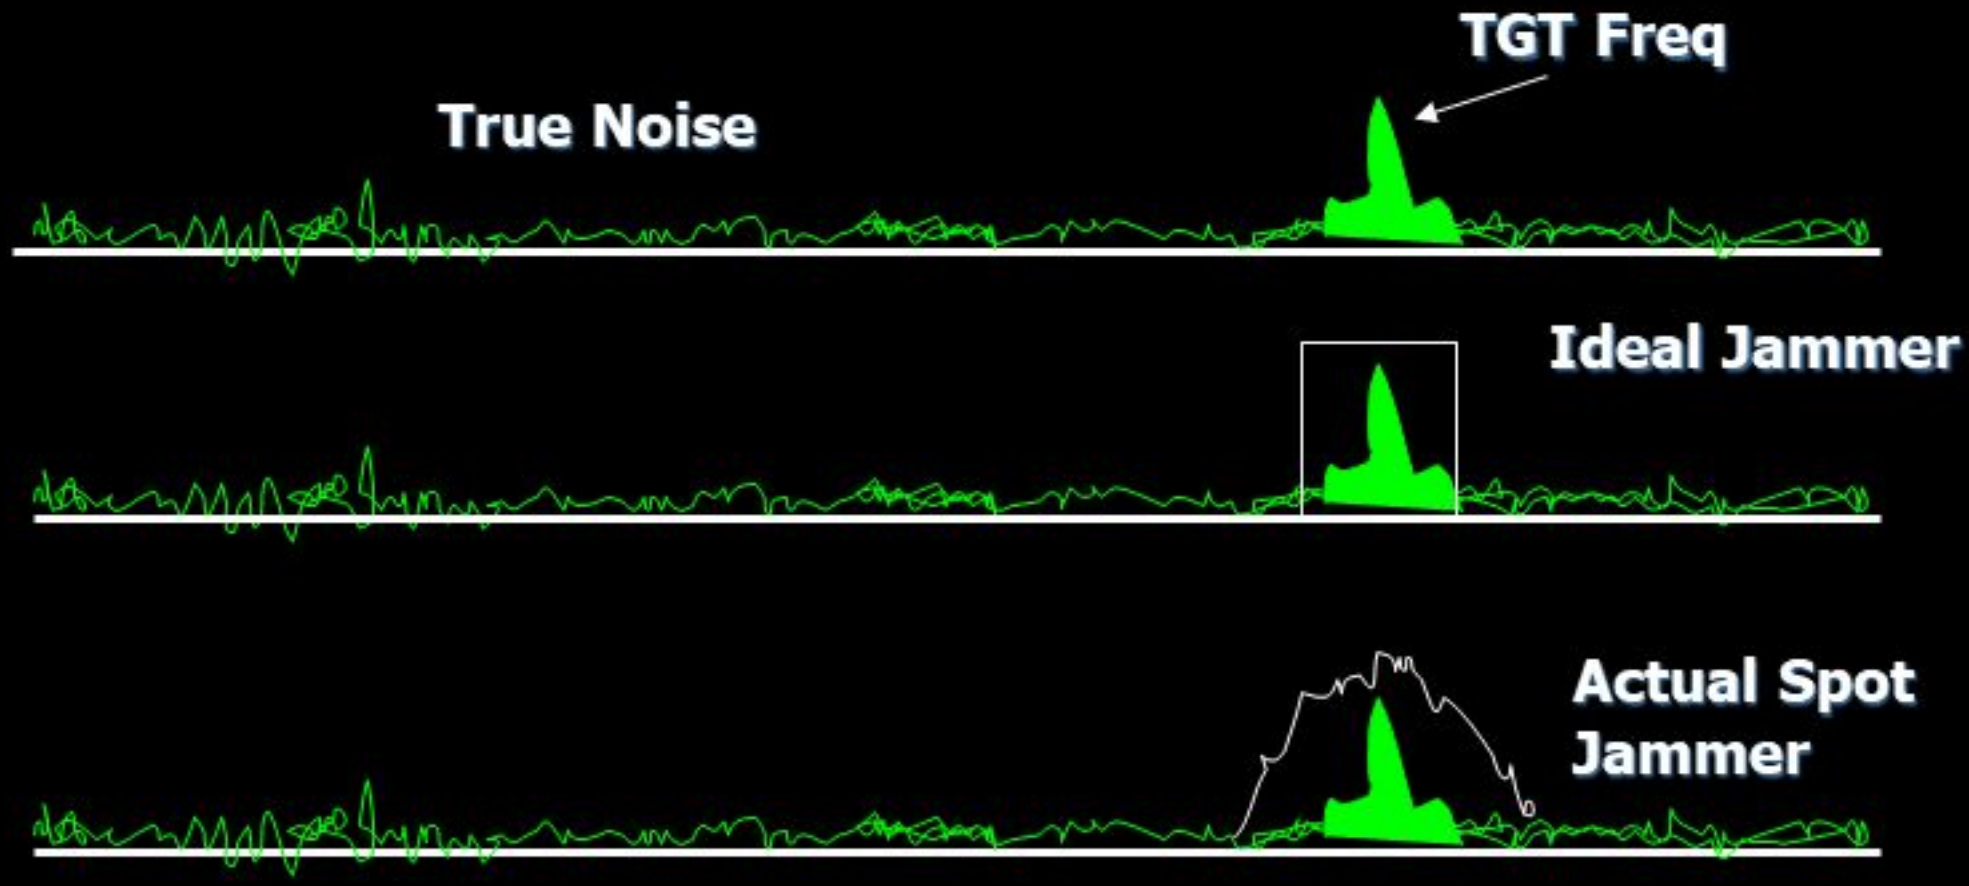
BY KATHERINE OWENS • JUN 05, 2017

Army trainers successfully used cyber weapons and electronic warfare (EW) technology to thwart a simulated tank assault at a training exercise conducted at the Army National Training Center at Fort Irwin, Calif. The exercise reinforced the need for the EW and cyber protection technology that is under development by entities such as the Army Rapid Capabilities Office (RCO) and U.S. Cyber Command.

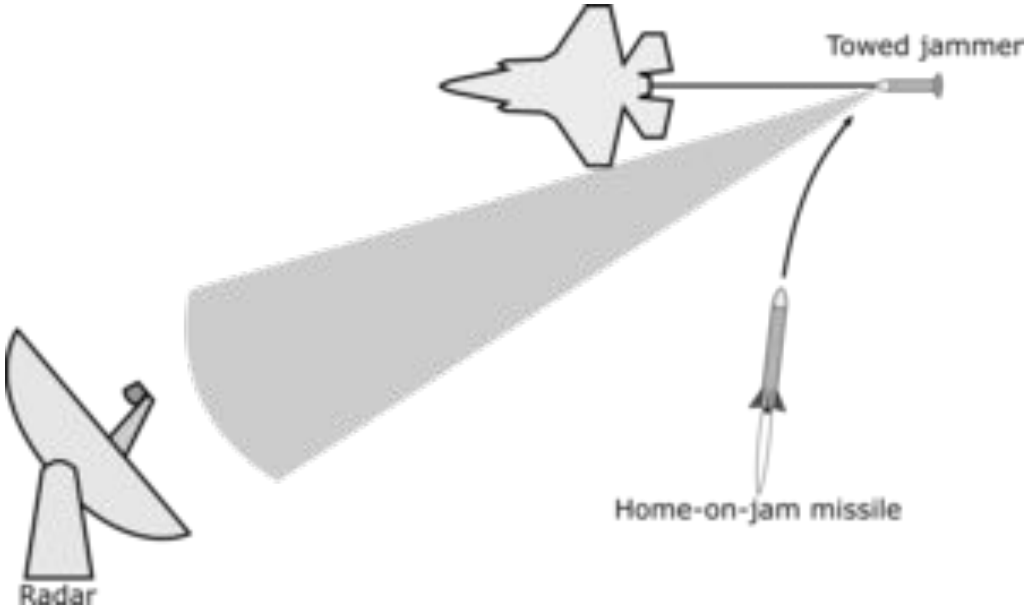
"These tanks had to stop, dismount, get out of their protection, reduce their mobility," said Capt. George Puryear, an Irregular Operations Officer at Fort Irwin. As a result, they were easily defeated.

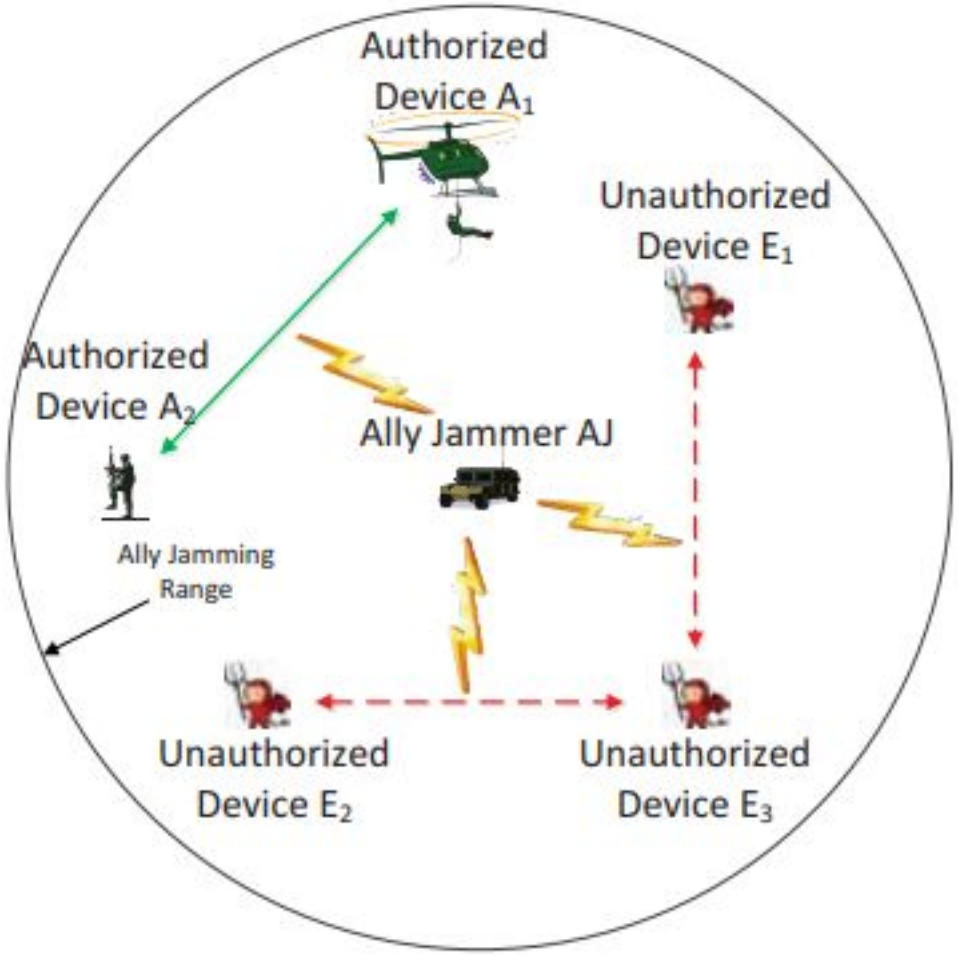
DEFENSE SYSTEMS

Jamming

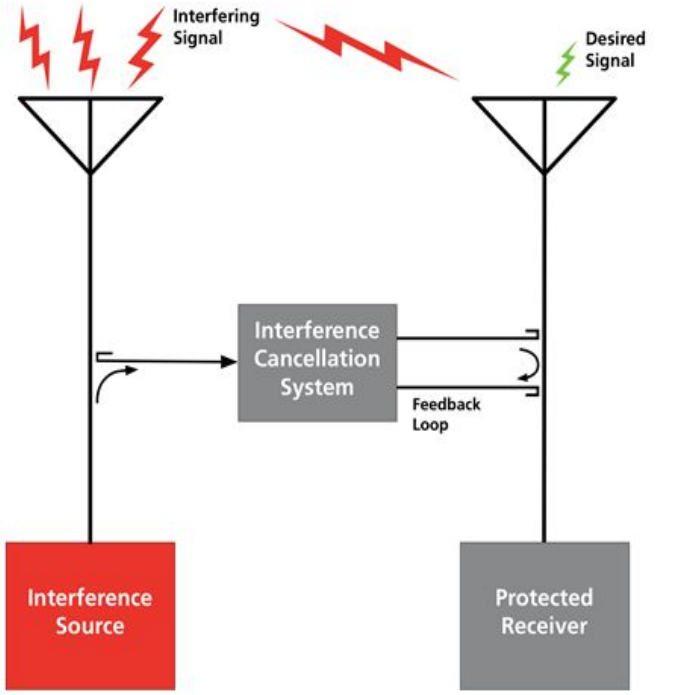


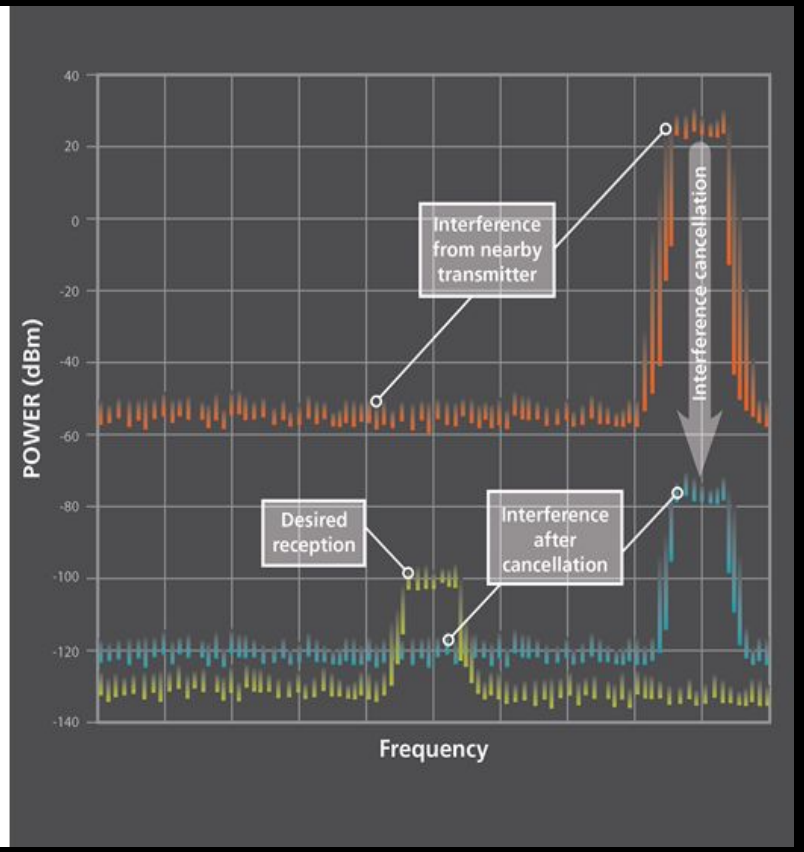
How do we communicate while Jamming?





How do we communicate while Jamming?





EA-18G Interference Cancellation System (INCANS)

A question of power

P: Transmitter power (100 kW) wavelength λ

Power reaching aircraft at range r: $\frac{GP}{4\pi r^2}$

Reflected power: $\frac{GPA}{4\pi r^2}$

Power reaching receiver: $\frac{GPA}{16\pi^2 r^4}$

Power received: $P_r = \frac{G^2 P A \lambda^2}{64\pi^3 r^4}$

If r = 10km then received power is in pico Watts!

Internet of Military Things (IoMT)

The ‘B’ in IoBT - Internet of Battlefield Things:

- Adversarial and hostile environments
- Extreme and wide ranging weather and physical environment
- Often not retrieved or not safe to retrieve
- Service calls for malfunctioning or compromised device are not a phone call away
- Time constraints are critical to the success of a mission but a device needs to be able to remain dormant and functional until then.

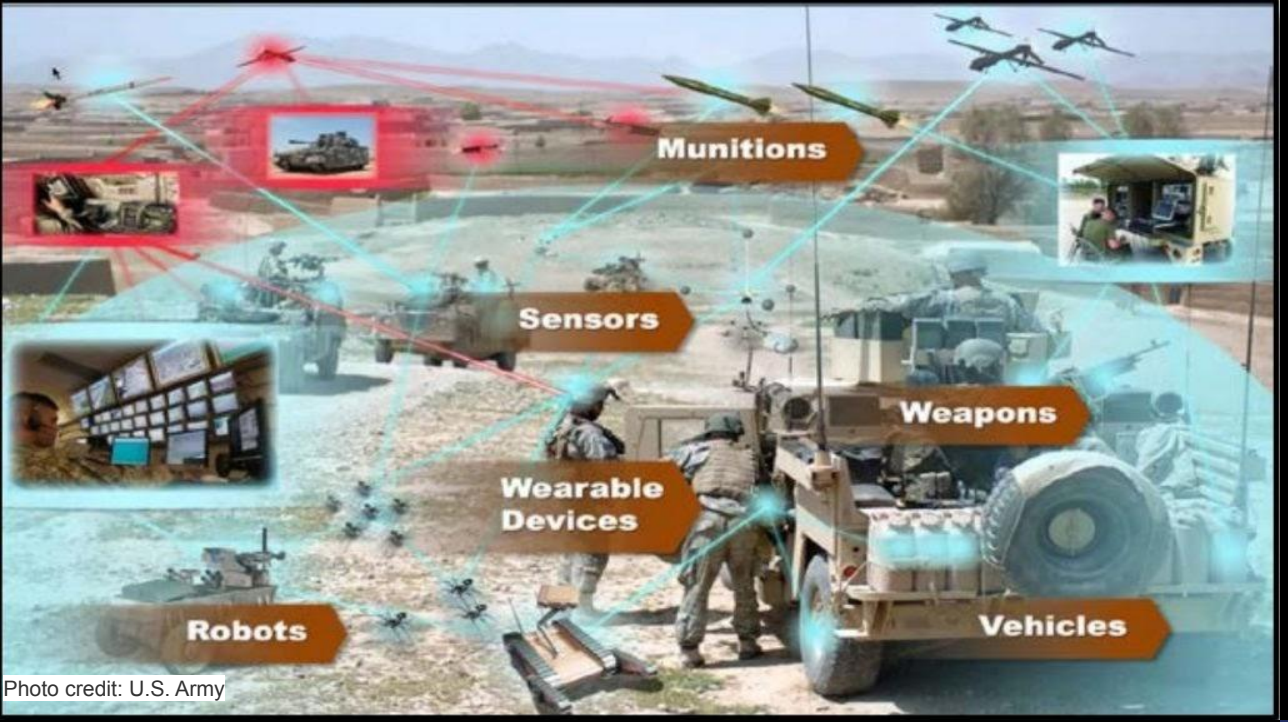

Photo credit: U.S. Army

Internet of Battlefield Things - Key Properties

- ➔ Diverse ownership:
  - Friendly (BLUE)
  - Neutral/Civilian (GREY)
  - Enemy (RED)
- ➔ Growing variety of devices
- ➔ Dynamic asset + environment conditions
- ➔ Potential for degraded compromised networking infrastructure

Key Technology trends impacting IoBT:

- AI and Analytics
- Sensors
- Health Monitoring Systems
- Processors and Transmitters
- Data Storage
- Security

OPENTOTEX

Drone is hard to be detected by naked eye.

- Technological reasons:
  - Small size ➔ small RCS signal buried in many noisy environments.
  - Slow-moving ➔ moving target detector sets a higher threshold.
    - Ground/Sea clutters.
    - Related to drone pulses, PRF, RPI, CPI design etc.
  - Earth geometry and landscape blockage.
  - Too many similar targets for be tracked.
- Trade-offs between:
  - “false alarm” versus “missed targets”
  - “cost” and “performance”.

Radars need to be tailored to be able to detect drones.

Space Warfare: Strategy and Principles

There are several potential objectives for an attacking force in a space war:

1. Deceive an enemy so that they react in ways that hurt their interests

2. Disrupt, deny, or degrade an enemy's ability to use a space capability, either temporarily or permanently

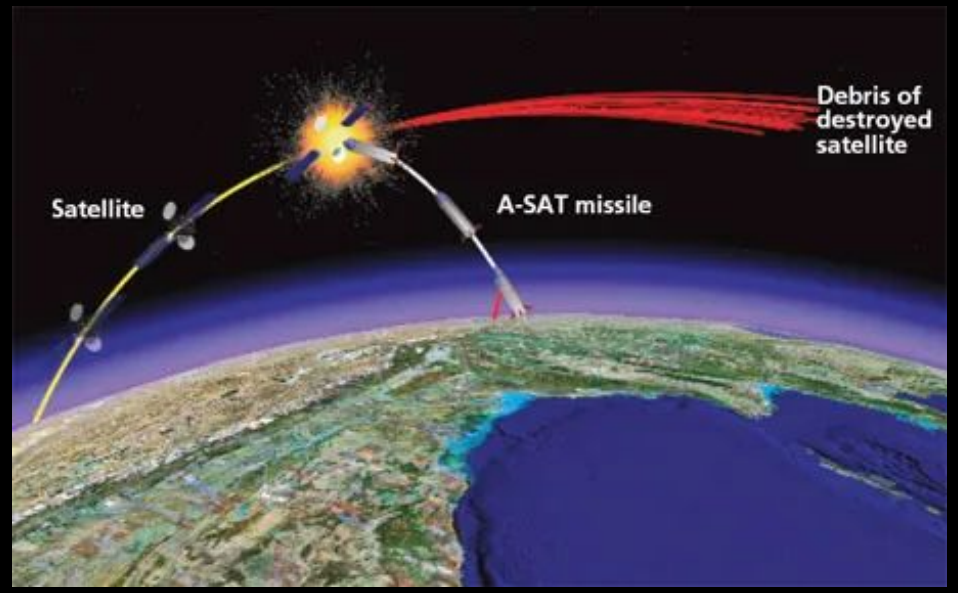
3. Destroy completely a space-based capability

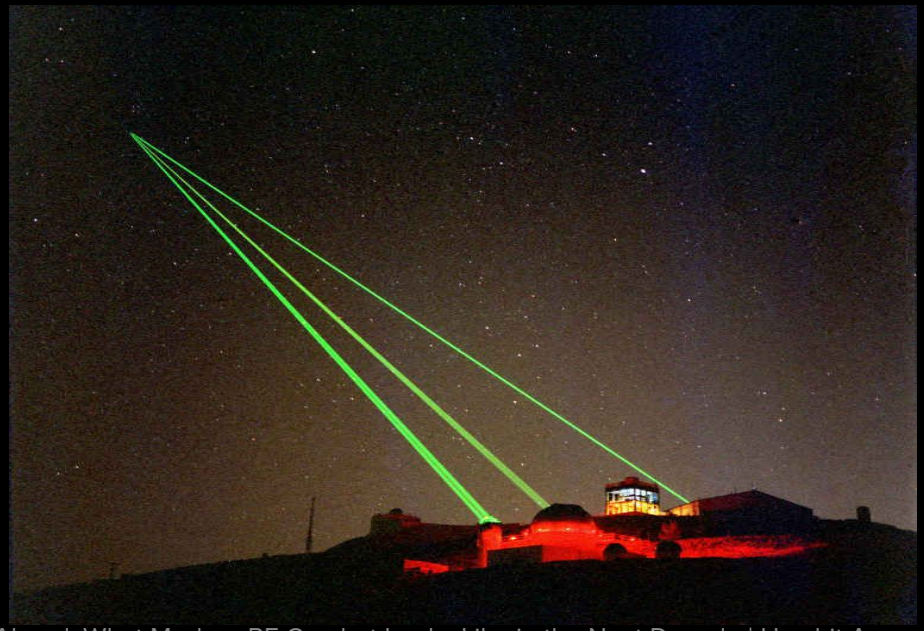
4. Deter or defend against a counter attacking adversary, either in space or on Earth

Counterspace Weapons

Kinetic Physical Attack

- Direct Ascent-SAT
- Co-Orbital ASAT
- Ground Station Attack





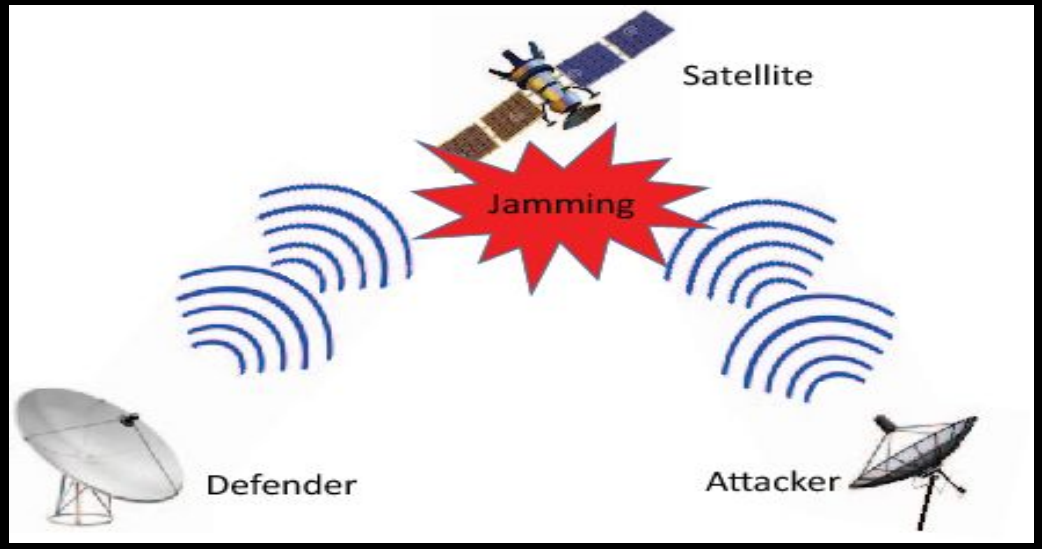
Non-Kinetic Attack

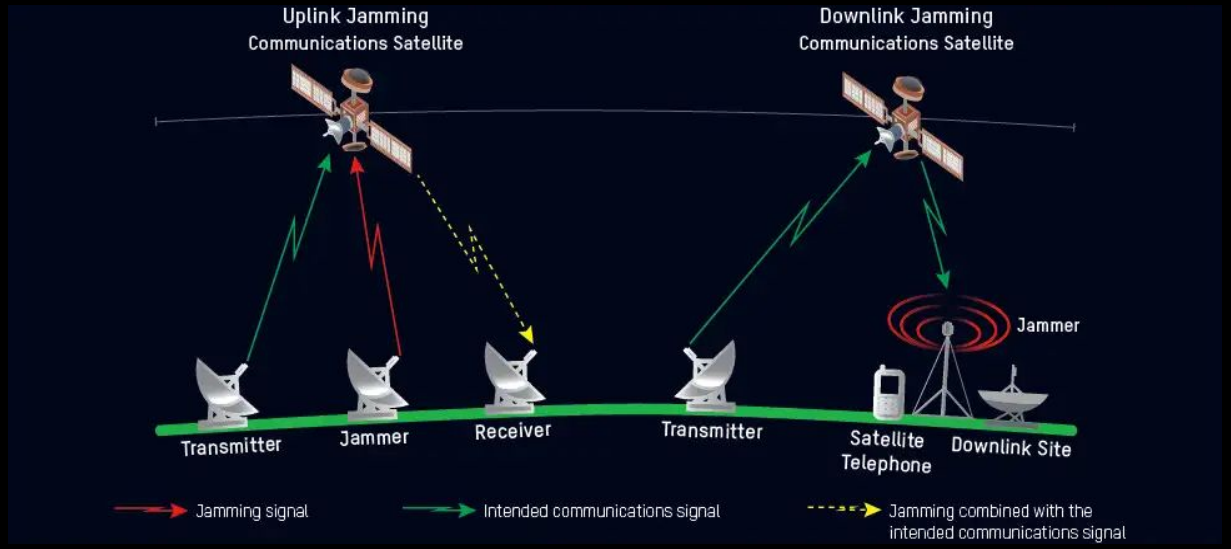
- Electromagnetic Pulse Attack
- High-Powered Laser
- High-Powered Microwave

Counterspace Weapons

Electronic Warfare

- Jamming
- Spoofing





Cyber Attack

- Data Intercept / Monitoring
- Data Corruption
- Seizure of Control

Space Warfare

- Electronic Warfare, Directed Energy, and Cyberattacks
  - Intensity Dissipation
  - Precision
    - Frequency
    - Polarization
    - Signal Strength

The EMP Threat: Examining the Consequences

Conclusions:

- War Fighting Environment will continue to change, & be more reliant on Spectrum for operations
- Spectrum is a critical manoeuvre(sp) space – one can make a difference by advancing there tradecraft
- To Counter current and evolving threat: EW, Cyber, Spectrum Operations, Spectrum Manoeuvre is required
- Airborne EW must include Multi-function Weapons
- Rapid Threat detection, Cooperative Systems, Coherent Effects, Cognitive and Autonomous Systems

Thank You For Attending My Talk. ☺️
